- Note 1. The polarity of VCOM should be generated from POL through driving circuit. The H/L voltage level of POL is VDD/GND. Hence, it cannot be used as Vcom signal directly. The phase shift from POL to Vcom can be set as either 0° or 180° by 3-wire SPI interface.
- Note 2. For digital RGB input data format, both SYNC mode and DE+SYNC mode are supported. If ENB signal is fixed low, SYNC mode is used. Otherwise, DE+SYNC mode is used.
- Note 3. SPENA . SPCLK are usually pulled high.

- Note 1: Measurement should be performed in the dark room, optical ambient temperature = $25^{\circ}$ C, and backlight current  $I_1$ =20 mA
- Note 2: To be measured on the center area of panel with a field angle of 1 by Topcon luminance meter BM-7, after 10 minutes operation.
- Note 3: Definition of response time:

The output signals of photo detector are measured when the input signals are changed from "black" to "white" (falling time) and from "white" to "black" (rising time), respectively.

Page: 19/28

Note 4. From liquid crystal characteristics, response time will become slower and the color of panel will become darker when ambient temperature is below 25°C.

Contrastratio = Photo detector output when LCD is at "White" state

Photo detector output when LCD is at "Black" state

Note 5. Contrast ratio is calculated with the following formula.

Note 6. White Vi=Vi50 + 1.5V

Black Vi=Vi50 ± 2.0V

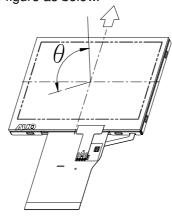

"±" means that the analog input signal swings in phase with COM signal.

"<sup>+</sup>" means that the analog input signal swings out of phase with COM signal.

Vi50 :The analog input voltage when transmission is 50%

The 100% transmission is defined as the transmission of LCD panel when all the input terminals of module are electrically opened.

Note 7. Definition of viewing angle: refer to figure as below.

Note 8. The viewing angles are measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.

Note 9. Gamma value is measureed under the typical timing condition.

Luminance Uniformity =

Max. Brightness of nine point

Note 2: Notes Life test condition (by pen): Notes area for pen notes life test is 10×9 mm. Size of word is 7.5×6.75mm. Word is any A.B.C.... letter. Writing speed is 60mm/s. Center of each word is changed at random in notes area.

#### Guaranteed active area

Note 3: Input Life test condition( by finger): By silicone rubber tapping at same point. Tapping Load is 200g, and tapping frequency is 5Hz.

#### 5. Attention

Please pay attention for below matters at mounting design of touch panel of LCD module.

- 1. Do not design enclosure pressing the view area to prevent from miss input.
- 2. Enclosure support must not touch with view area.
- 3. Use elastic or non-conductive material to enclosure touch panel.
- 4. Do not bond film of touch panel with enclosure.
- 5. The touch panel edge is conductive. Do not touch it with any conductive part after mounting.
- 6. If user wants to cleaning touch panel by air gun, pressure 2kg/cm2 below is suggested. Not to blow glass from FPC site to prevent FPC peeled off.

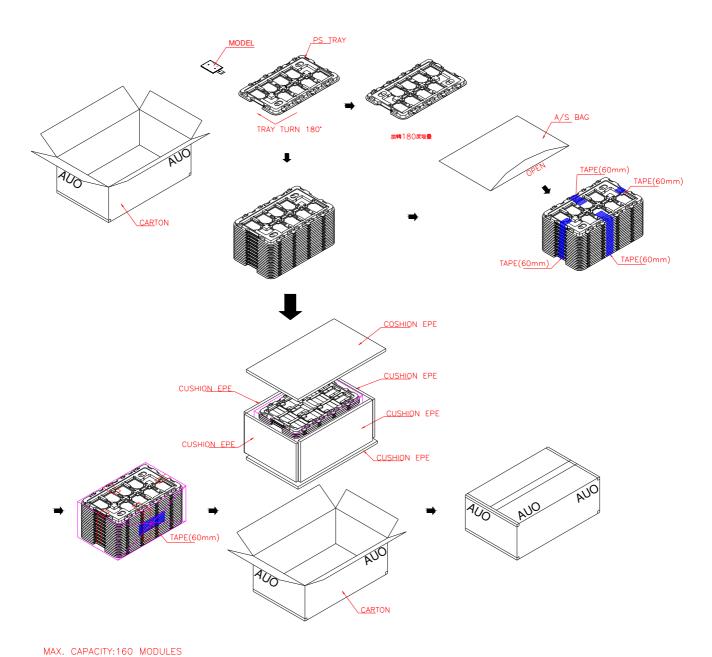

- 7. Do not put a heavy shock or stress on touch panel and film surface. Ex. Don't lift the panel by film face with vacuum.
- 8. Do not lift LCD module by FPC.
- Please use dry cloth or soft cloth with neutral detergent (after wring dry) or one with ethanol at cleaning.Do not use any organic solvent, acid or alkali liquor.
- 10. Do not pile touch panel. Do not put heavy goods on touch panel.

# J. Application Note

## i.Power on/off sequence

The LCD panel adopts high voltage driver ICs, so it could be permanently damaged if a wrong power on/off sequence is used. When powering on the LCD, VDD should go up firstly, and then turn on VGL and AVDD, and finally VGH. Turn off the LCD panel with reversed order or shut off all the power supplies simultaneously.

<Note>: The power-on intervals between AVDD and VGL/VGH can be less than 10ms. However, following the recommended power on sequence can eliminate the random start up display issue.

# ii.Application Notes - Vcom driving circuit

POL which is a digital output signal from LCM is used to generate Vcom signal. According to register R3, when POL\_OUT is 'L', POL and Vcom are in phase. Otherwise, POL and Vcom are reverse. Below application circuits are for POL\_OUT='L' and POL\_OUT='H', respectively. In the typical condition, Vcom AC is equal to 5V.

#### a. POL and Vcom are in phase (POL\_OUT='L')

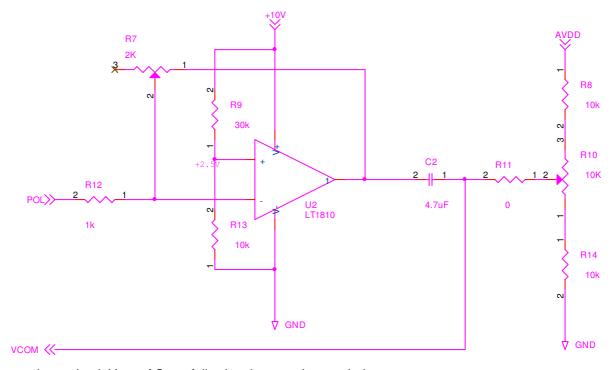

<Note> : The resistors R1, R3 and R6 are used to optimizing flicker by adjusting VcomDC value which equals to  $\frac{1}{2} (VcomH + VcomL).$

#### b. POL and Vcom are reversed

Base on above circuit Vcom AC are following the equations as below

$$Vcom\ AC = VDD * \frac{R_7}{R_{12}}$$

<Note> : The resistors R8, R10 and R14 are used to optimizing flicker by adjusting VcomDC value which equals to  $\frac{1}{2}(VcomH + VcomL)$ .
