5. Structure and Area Definition

Below figure illustrates the recommended bezel and cushion design. In order to prevent unusual performance degradation and malfunction of the touch panel, please carry out the set case designing and a touch panel assembling method after surely considering the definition of each area illustrated in below figure.

Area (a): Active area

The active area is guaranteed the position data detectable precision, operation force and other operations. It's strongly recommended to place the operation button or menu keys within the active area.

Area (b): Operating non-guaranteed area

The area doesn't guarantee a touch panel operation and its function. When this area is pressed, touch panel shows degradation of its performance and durability.

Area (c): Pressing prohibition area

The area which forbids pressing.

Area (d): Non-active area

The area doesn't activate even if pressed.

6. Attention

Please pay attention for below matters at mounting design of touch panel of LCD module.

- 1) Do not design enclosure pressing the view area to prevent from miss input.
- 2) Enclosure support must not touch with view area.
- 3) Do not put a heavy force along the edge of the active area.
- 4) Cushion material: Use elastic or non-conductive material to enclosure touch panel.
- 5) Do not bond film of touch panel with enclosure.
- 6) The touch panel edge is conductive. Do not touch it with any conductive part after mounting.
If user wants to cleaning touch panel by air gun, pressure 2kg/cm² below is suggested. Not to blow glass from FPC site to prevent FPC peeled off
- 7) Do not put a heavy shock or stress on touch panel and film surface. Ex. Don't lift the panel by film face with vacuum.
- 8) Do not lift LCD module by FPC.
- 9) Please use dry cloth or soft cloth with neutral detergent (after wring dry) or one with ethanol at cleaning.
Do not use any organic solvent, acid or alkali liquor.
- 10) Do not pile touch panel. Do not put heavy goods on touch panel.

The output signals of photo detector are measured when the input signals are changed from “black” to “white”(falling time) and from “white” to “black”(rising time), respectively.

The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to the figure below:

Note 4. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at "White" state}}{\text{Photo detector output when LCD is at "Black" state}}$$

Note 5. inition of viewing angle, Refer to figure as below.

Note 6. Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened

K. Handling Precautions

1. Since the touch panel is easily damaged, pay attention not to scratch it.
2. Be sure to turn off power supply when inserting or disconnecting from input connector.
3. Wipe off water drop immediately. Long contact with water may cause discoloration or spots.
4. When the panel surface is soiled, wipe it with absorbent cotton or other soft cloth.
5. Since the panel is made of glass, it may break or crack if dropped or bumped on hard surface.
6. Since CMOS LSI is used in this module, take care of static electricity and insure human earth when handling.
7. Do not open nor modify the Module Assembly.
8. Do not press the reflector sheet at the back of the module to any directions.
9. At the insertion or removal of the Signal Interface Connector, be sure not to rotate nor tilt the Interface Connector of the TFT Module.
10. After installation of the TFT Module into a system enclosure, do not twist nor bend the TFT Module even momentary. At designing the enclosure, it should be taken into consideration that no bending/twisting forces are applied to the TFT Module from outside. Otherwise the TFT Module may be damaged.
