Note 3. Definition of response time:

The output signals of photo detector are measured when the input signals are changed from "black" to "white" (falling time) and from "white" to "black" (rising time), respectively. The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 4. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Photo detector output when LCD is at "White" state}}{\text{Photo detector output when LCD is at "Black" state}}$$

Note 5. The 100% transmission is defined as the transmission of LCD panel when all the input

terminals of module are electrically opened.

Note 6. Definition of viewing angle. Refer to figure as below.

Note 7. Transmission is defined as follow: ( $\theta = 0^\circ$ )

$$\text{Transmission} = B1/B2$$

B1=Photo detector output voltage when measuring the brightness of the LCD panel

Placed on the light source with no applied voltage

B2=Photo detector output voltage when measuring the light source.

Note 8. Luminance Uniformity of these 9 points is defined as below:
