## e.Backlight unit

The backlight system is an edge-lighting type with a CCFT(Cold Cathode Fluorescent Tube).

The characteristics of a single lamp are shown in the following tables.

Parameter	Symbol	Min.	Typ.	Max.	Unit	Remark
Lamp voltage	$V_L$	(594)	(660)	(726)	Vrms	Note 1
Lamp current	$I_L$	3	6	6.5	mArms	Note 1
Power consumption	$P_L$	-	(3.96)		W	Note 2
Lamp starting voltage	$V_s$	-	-	(1530(T=0°C))	Vrms	Note 3
		-	-	(1250(T=25°C))		
Frequency	$F_L$	50	60	80	KHz	Note 4
Lamp life time	$L_L$	10000	-	-	Hr	Note 1, 5

Note 1: T= 25°C

Note 2: Inverter should be designed with the characteristic of lamp. When you are designing the inverter, the output voltage of the inverter should comply with the following conditions.

- (1). The area under the positive and negative cycles of the waveform of the lamp current and lamp voltage should be area symmetric (the symmetric ratio should be larger than 90%).
- (2). There should not be any spikes in the waveform.
- (3). The waveform should be sine wave as possible.
- (4). Lamp current should not exceed the maximum value within the operating temperature (It is prohibited to over the maximum lamp current even if operated in the non-guaranteed temperature). When lamp current over the maximum value for a long time, it may cause fire. Therefore, it is recommend that the inverter should have the current limited circuit.

Note 3: The inverter open voltage should be designed larger than the lamp starting voltage at T=0°C otherwise backlight may be blinking for a moment after turning on or not be able to turn on. The open voltage should be measured after ballast capacitor. If an inverter has shutdown function it should keep its open voltage for longer than 1 second even if lamp connector is open.

Note 4: Lamp frequency may produce interference with horizontal synchronous frequency and this may cause line flow on the display. Therefore lamp frequency shall be detached from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.

Note 5: Brightness ( $I_L=6mA$ ) to be decrease to the 50% of the initial value.

Note 6: CN2 connector (backlight): BHSR-02VS-1 (JST)

Mating connector: SM02B-BHSS-1-TB (JST)

Note 2: To be measured in dark room after lighting the backlight for 30 minutes.

Note 3: To be measured with a viewing cone of 1° by Topcon luminance meter BM-5A.

Note 4: Definition of response time:

The output signals of BM-7 are measured when the input signals are changed from "Black" to "White" (falling time) and from "White" to "Black" (rising time), respectively. The response time interval between the 10% and 90% of amplitudes. Refer to figure as below.

Note 5. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

$$\text{Contrast ratio (CR)} = \frac{\text{Brightness on the "White" state}}{\text{Brightness on the "Black" state}}$$

Note 6: Definition of brightness:

$$\text{Brightness}( Y_L) = \frac{Y_{LD} + Y_{LE} + Y_{LG} + Y_{LI} + Y_{LJ}}{5}$$

Note 7: Driving conditions for CCFL :  $I_L = 6.0 \text{ mA}$ ,  $60 \text{ KHz}$  frequency.

Note 8: Definition of viewing angle.

Note 9: Definition of white uniformity:

White uniformity is defined as the following with thirteen measurements (A~M).
