1.0 Handling Precautions

1) Since front polarizer is easily damaged, pay attention not to scratch it.
2) Be sure to turn off power supply when inserting or disconnecting from input connector.
3) Wipe off water drop immediately. Long contact with water may cause discoloration or spots.
4) When the panel surface is soiled, wipe it with absorbent cotton or other soft cloth.
5) Since the panel is made of glass, it may break or crack if dropped or bumped on hard surface.
6) Since CMOS LSI is used in this module, take care of static electricity and insure human earth when handling.
7) Do not open or modify the Module Assembly.
8) Do not press the reflector sheet at the back of the module to any directions.
9) In case if a Module has to be put back into the packing container slot after once it was taken out from the container, do not press the center of the CCFL reflector edge. Instead, press at the far ends of the CCFL Reflector edge softly. Otherwise the TFT Module may be damaged.
10) At the insertion or removal of the Signal Interface Connector, be sure not to rotate nor tilt the Interface Connector of the TFT Module.
11) After installation of the TFT Module into an enclosure, do not twist nor bend the TFT Module even momentary. At designing the enclosure, it should be taken into consideration that no bending/twisting forces are applied to the TFT Module from outside. Otherwise the TFT Module may be damaged.
12) Cold cathode fluorescent lamp in LCD contains a small amount of mercury. Please follow local ordinances or regulations for disposal.
13) Small amount of materials having no flammability grade is used in the LCD module. The LCD module should be supplied by power complied with requirements of Limited Power Source (IEC60950 or UL1950), or be applied exemption.
14) The LCD module is designed so that the CCFL in it is supplied by Limited Current Circuit (IEC60950 or UL1950). Do not connect the CCFL in Hazardous Voltage Circuit.

2.0 General Description

This specification applies to the 24 inch-wide Color a-Si TFT-LCD Module M240UW04.

The display supports the WUXGA (1920(H) x 1200(V)) screen format and 16.7M colors (RGB 6-bits + Hi-FRC data).

All input signals are 2 channel LVDS interface compatible.

This module doesn't contain an inverter board for backlight.

2.1 Display Characteristics

The following items are characteristics summary on the table under 25 ℃ condition:

ITEMS	Unit	SPECIFICATIONS
Screen Diagonal	[mm]	611.32(24")
Active Area	[mm]	518.4 (H) x 324 (V)
Pixels H x V		1920(x3) x 1200

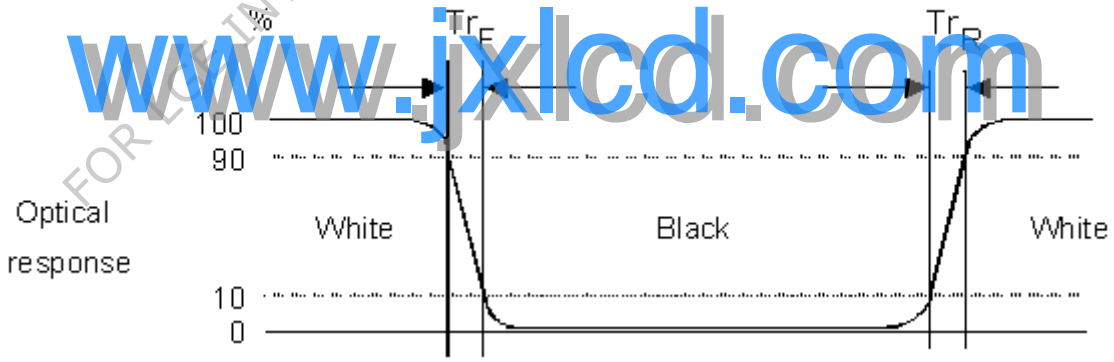
Note 1: **Definition of Response time**

The output signals of photodetector are measured when the input signals are changed from "Black" to "White" (rising time), and from "White" to "Black "(falling time), respectively. The response time is interval between the 10% and 90% of amplitudes.

www.jxlcd.com



Note 2: **Definition of viewing angle*:*** measured by ELDIM (EZContrast 88)
Viewing angle is the measurement of contrast ratio □10, at the screen center, over a 180° horizontal and 180° vertical range (off-normal viewing angles). The 180° viewing angle range is broken down as follows; 90° (θ) horizontal left and right and 90° (Φ) vertical, high (up) and low (down). The measurement direction is typically perpendicular to the display surface with the screen rotated about its center to develop the desired measurement viewing angle.

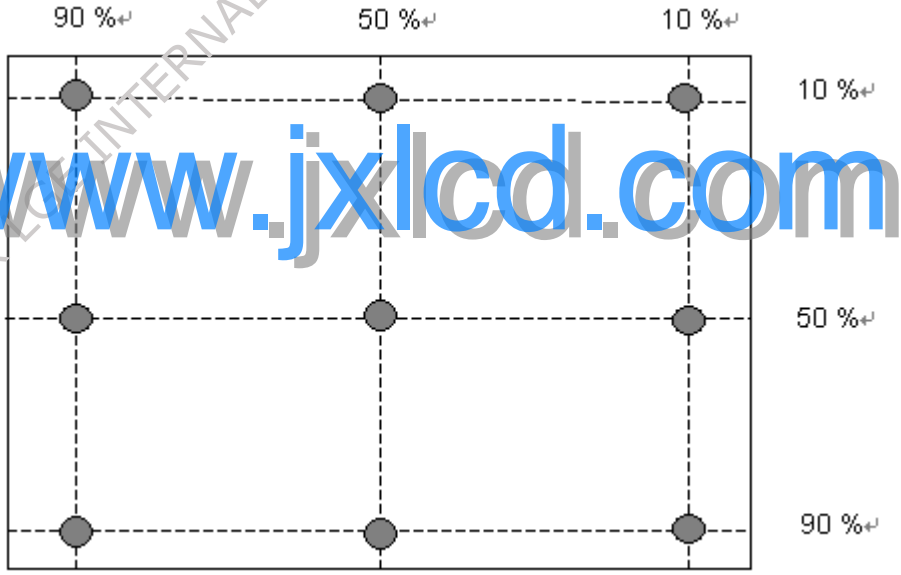
Note 3: **Luminance uniformity of these 9 points is defined as below**



$$\text{Uniformity} = \frac{\text{Minimum Luminance in 9 points (1 - 9)}}{\text{Maximum Luminance in 9 Points (1 - 9)}}$$

Note 4: **Crosstalk is defined as below :**

$$CT = | YB - YA | / YA \times 100\ (\%)$$

Where

YA = Luminance of measured location without gray level 0 pattern (cd/m2)

YB = Luminance of measured location with gray level 0 pattern (cd/m2)

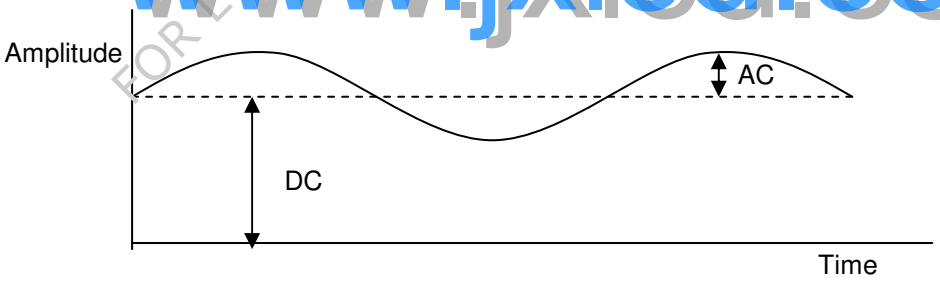
Method: Record CAV & DC value with (WESTAR)TRD-100



$$\text{Flicker (dB)} = 20\log\frac{\text{AC Level(at 30 Hz)}}{\text{DC Level}}$$

Note 6: **SPD Measurement is defined as below:** measured by Otsuka MPRT-1000

MPRT(Moving Picture Response Time) is the average value of BET measured from 72 combinations of different gray levels.
We divide the measurement base on each 32 grey level. Because the brightness between L0 & L32 is so slight and it will cause noise to influence the outcome, we set L42 instead of L32. We can get 72 combination data as the table below.

Background (End Gray) \ Start Gray	L0	L42	L64	L96	L128	L160	L192	L224	L255
L0		BET9	BET17	BET25	BET33	BET41	BET49	BET57	BET65
L42	BET1		BET18	BET26	BET34	BET42	BET50	BET58	BET66

$$\text{MPRT (seconds)} = \frac{\text{BET}_1 + \text{BET}_2 + \ldots + \text{BET}_{72}}{72}$$

$$\text{BET} = \text{BEW} \times \frac{1}{\text{scrolling speed} \times \text{frame rate}}$$

BEW: Blur Edge Width (LCD pixel). The width is defined to be used for the values 10%~90% of luminance.
Note: scrolling speed=8ppf (LCD pixel/frame rate) ; frame rate=60Hz

5.2 Backlight Unit

Parameter guideline for CCFL Inverter is under stable conditions at 25□ (Room Temperature):

Parameter	Min.□	Typ.	Max.□	Unit	Condition
CCFL Operation Current(ICFL)	2.0	6.0	8.0	[mA] rms	Note 2
CCFL Frequency(FCFL)	40	53	57	[KHz]	Note 3,4

CCFL Ignition Voltage(ViCFL, Ta= 25□)	2400	-	-	[Volt] rms	
CCFL Operation Voltage (VCFL)	-	1916 (@ 6mA)	-	[Volt] rms	Note 6
CCFL Power Consumption(PCFL)		69	-	[Watt]	Note 6
CCFL Life Time(LTCFL)	40,000	50,000	-	[Hour]	Note 7

FOR AUO INTERNAL USE ONLY
www.jxlcd.com

Note 1: Typ. are AUO recommended design points.

*1 All of characteristics listed are measured under the condition using the AUO test inverter.

*2 In case of using an inverter other than listed, it is recommended to check the inverter carefully. Sometimes, interfering noise stripes appear on the screen, and substandard luminance or flicker at low power may happen.

*3 In designing an inverter, it is suggested to check safety circuit very carefully. Impedance of CCFL, for instance, becomes more than 1 [M ohm] when CCFL is damaged.

*4 Generally, CCFL has some amount of delay time after applying kick-off voltage. It is recommended to keep on applying kick-off voltage for 1 [Sec] until discharge.

*5 Reducing CCFL current increases CCFL discharge voltage and generally increases CCFL discharge frequency. So all the parameters of an inverter should be carefully designed so as not to produce too much leakage current from high-voltage output of the inverter.

Note 2: CCFL standard current is measured at 25±2℃.

Note 3: CCFL discharge frequency should be carefully determined to avoid interference between inverter and TFT LCD.

Note 4: The frequency range will not affect to lamp life and reliability characteristics.

Note 5: CCFL inverter should be able to give out a power that has a generating capacity of over 2570 voltage. Lamp units need 2570 voltage minimum for ignition.

Note 6: The variance of CCFL power consumption is ±10%. Calculator value for reference (IRCFL × VCFL × 6 = PCFL)

Note 7: Definition of life time: brightness becomes 50%. The minimum life time of CCFL unit is on the condition of 6mA CCFL current and 25±2℃.

Note 1: The TFT-LCD module will not sustain damage after being subjected to 100 cycles of rapid temperature change. A cycle of rapid temperature change consists of varying the temperature from -20℃ to 60℃, and back again. Power is not applied during the test. After temperature cycling, the unit is placed in normal room ambient for at least 4 hours before power on.

Note 2: According to EN61000-4-2 , ESD class B: Some performance degradation allowed. No data lost. Self-recoverable. No hardware failures.
