T200XW02 Ver0.7 4/26
No Reproduction and Redistribution Allowed
1. General Description

This specification applies to the 20.0 inch Color TFT-LCD Module T200XW02.
This module supports the WXGA (1366(H) x 768(V)) screen format and 16.2M colors (6-bits + FRC).
All input signals are 1 channel LVDS interface compatible.
This module is without any inverter card for backlight.

Features

- WXGA 1366(H) x 768(V) resolution
- Fast response Time (8ms)
- 50,000 hours lamp life
- 6 CCFL Side Light Design (Cold Cathode Fluorescent Lamp)
- High brightness, High contrast ratio
- Wide viewing angle
- Low power consumption
- Green Design (ROHS Compliance)
- HDTV Ready Module

Application

Personal TV
Multi-function media
Video Game Console
* General Information

<td>90</td>
<td>[%RH]</td>
<td>2</td>
</tr>
</tbody>
</table>

Note 1: Duration = 50msec

Note 2: Maximum Wet-Bulb should be 39°C and No condensation.
3. **Electrical Specification**

The T200XW02 requires two power inputs. One is employed to power the LCD electronics and to drive the TFT array and liquid crystal. An inverter typically generates the second input, which powers the CCFL.

### 3-1 Electrical Characteristics

</tr>
<tr>
<td>Life Time</td>
<td></td>
<td>50000</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

The performance of the Lamp in LCM, for example lifetime or brightness, is extremely influenced by the characteristics of the DC-AC Inverter. So all the parameters of an inverter should be carefully designed so as not to produce too much leakage current from high-voltage output of the inverter. When you design or order the inverter, please make sure unwanted lighting caused by the mismatch of the lamp and the inverter (no lighting, flicker, etc) never occurs. When you confirm it, the LCD Assembly should be operated in the same condition as installed in your instrument.

Do not attach a conducting tape to lamp connecting wire. If the lamp wire attach to conducting tape, TFT-LCD Module have a low luminance and the inverter has abnormal action because leakage current occurs between lamp wire and conducting tape.

The relative humidity must not exceed 80% non-condensing at temperatures of 40°C or less. At temperatures greater than 40°C, the wet bulb temperature must not exceed 39°C. When operate at low temperatures, the brightness of CCFL will drop and the lifetime of CCFL will be reduced.

**Note:**

1. Vdd=5.0V, Fv=62Hz, f_{CLK} = 88MHz , 25°C, Vdd Duration time= 470 µs

   The Power supply input check pattern definition and dissipation reference as below :

   Dot pattern : 0.9A (Max.)
White pattern: 0.69 A

Black pattern: 0.75 A

Vertical gray scale pattern: 0.72 A (Typ.)

2. The lamp power consumption shown above does include loss of external inverter at 25°C. The used lamp current is the lamp current typical value. Assumption: the efficiency of Inverter is 80%. BLU actual power is 32.64W, BLU power consumption need to consider the efficiency of Inverter, and should be 32.64 / 80% = 40.8W (typ) and 43.2W (max). TTL Power = 40.8 + 3.6 = 44.4W (typ) and 46.8W (max).

3. The life is determined as the time at which luminance of the lamp is 50% compared to that of initial value at the typical lamp current on condition of continuous operating at 25±2°C. The lamp current should fix at 6.5mA (typ.) and then keep the 50000hr (typ.) lamp life.
3-2 Interface Connections

- LCD connector (CN1): JAE FI-X30SSL-HF or equivalent
- LVDS Transmitter: SN75LVDS83 (Texas Instruments) or equivalent

Note:
1. All GND (ground) pins should be connected together and should also be connected to the LCD’s metal frame. All Vcc (power input) pins should be connected together.

*1) CLK signal input must be valid while power supply is applied.

*2) Display position is specific by the rise of DE signal only.

Horizontal display position is specified by the falling edge of 1st CLK right after the rise of DE, is displayed on the left edge of the screen. Vertical display position is specified by the rise of DE after a “Low” level period equivalent to eight times of horizontal period. The 1st data corresponding to one horizontal line after the rise of DE is displayed at the top line of screen.

3.) If a period of DE “High” is less than 1366 CLK or less than 768 lines, the rest of the screen displays black.

4.) The display position does not fit to the screen if a period of DE “High” and the effective data period do not synchronize with each other.

### 3-5 Color Input Data Reference

The brightness of each primary color (red, green and blue) is based on the 8 bit gray scale data input for the color; the higher the binary input, the brighter the color. The table below provides a reference for color versus data input.

<table>

3-6 Power Sequence

Apply the lamp voltage within the LCD operating range. When the backlight turns on before the LCD operation or the LCD turns off before the backlight turns off, the display may momentarily become abnormal.

**Caution:** The above on/off sequence should be applied to avoid abnormal function in the display. In case of handling, make sure to turn off the power when you plug the cable into the input connector or pull the cable out of the connector.
4. Optical Specification

Optical characteristics are determined after the unit has been 'ON' and stable for approximately 30 minutes in a dark environment at 25°C. The values specified are at an approximate distance 50cm from the LCD surface at a viewing angle of $\phi$ and $\theta$ equal to 0°.

No Reproduction and Redistribution Allowed
Note:

1. Contrast Ratio (CR) is defined mathematically as:

   \[
   \text{Contrast ratio (CR)} = \frac{\text{Brightness on the white (L255) state}}{\text{Brightness on the black (L0) state}}
   \]

2. Surface luminance is luminance value at point 1 across the LCD surface 50cm from the surface with all pixels displaying white. From more information see FIG 4-2. When \( I_{BL} = 6.5 \text{mA}, \ L_{WH} = 450 \text{cd/m}^2 \) (typ.) \( L_{WH} = L_{on1} \), where \( L_{on1} \) is the luminance with all pixels displaying white at center 1 location.

3. The variation in surface luminance, \( \delta \text{WHITE} \) is defined (center of Screen) as:

   \[
   \delta_{\text{WHITE}}(9P) = \frac{\text{Maximum}(L_{on1}, L_{on2}, \ldots, L_{on9})}{\text{Minimum}(L_{on1}, L_{on2}, \ldots, L_{on9})}
   \]

4. Response time is the time required for the display to transition from white(L255) to black(L0) (Decay Time, \( T_D = T_f \)) and from black(L0) to white(L255) (Rise Time, \( T_R = T_r \)). The response time interval is between the 10% and 90% of 1st frame amplitudes. For additional information see FIG 4-3.

---

**Fig.4-2 Optical measurement point**

**Fig.4-3 Response time**
5. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface. For more information see FIG 4-5.

6. To be measured with a viewing cone of 1° by Topcon luminance meter ELDIM EZ Contrast 160D.
5. **Mechanical Characteristics**

The contents provide general mechanical characteristics for the model T200XW02. In addition the figures in the next page are detailed mechanical drawing of the LCD.

7. Packing

Label Sample

Green Mark Description:
For Pb Free products, AUO will add 🟠 for identification.
For RoHS compatible products, AUO will add 🟦 for identification.

Note. The Green Mark will be present only when the green documents have been ready by AUO Internal Green Team. (The definition of green design follows the AUO green design checklist)

MODEL NO: T200XW02 VX
PART NO: 97.20T02.XXX
CUSTOMER NO:
CARTON NO: *PM100-01A1600001*

Made in Taiwan

Cushion set

Carton Box, 320mm(W)x590mm(L)x410mm(H)
Pallet Package

Air Cargo: (3 * 2) * 3 layers, total 18 boxes with 108 pcs panel in one pallet

Ocean shipping: (3 * 2) * 5 layers, total 30 boxes with 180 pcs panel in one pallet
8. PRECAUTIONS

Please pay attention to the followings when you use this TFT LCD module.

8-1 MOUNTING PRECAUTIONS

(1) You must mount a module using holes arranged in four corners or four sides.
(2) You should consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
(3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to the resist external force.
(4) You should adopt radiation structure to satisfy the temperature specification.
(5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
(6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics are detrimental to the polarizer.)
(7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front/ rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
(8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
(9) Do not open the case because inside circuits do not have sufficient strength.

8-2 OPERATING PRECAUTIONS

(1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage: V=±200mV (Over and under shoot voltage)
(2) Response time depends on the temperature. (In lower temperature, it becomes longer.)
(3) Brightness depends on the temperature. (In lower temperature, it becomes lower.) And in lower temperature, response time (required time that brightness is stable after turned on) becomes longer.
(4) Be careful for condensation at sudden temperature change. Condensation makes
damage to polarizer or electrical contacted parts. And after fading condensation, smear
or spot will occur.
(5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
(6) Module has high frequency circuits. Sufficient suppression to the electromagnetic
interference shall be done by system manufacturers. Grounding and shielding methods
may be important to minimize the interface.

8-3 ELECTROSTATIC DISCHARGE CONTROL
Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make
certain that treatment persons are connected to ground through wrist band etc. And don't touch
interface pin directly.

8-4 PRECAUTIONS FOR STRONG LIGHT EXPOSURE
Strong light exposure causes degradation of polarizer and color filter.

8-5 STORAGE
When storing modules as spares for a long time, the following precautions are necessary.
(1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the
temperature between 5°C and 35°C at normal humidity.
(2) The polarizer surface should not come in contact with any other object. It is recommended that
they be stored in the container in which they were shipped.

8-6 HANDLING PRECAUTIONS FOR PROTECTION FILM
(1) The protection film is attached to the bezel with a small masking tape. When the protection film is
peeled off, static electricity is generated between the film and polarizer. This should be peeled off
slowly and carefully by people who are electrically grounded and with well ion-blown equipment or
in such a condition, etc.
(2) When the module with protection film attached is stored for a long time, sometimes there remains
a very small amount of flue still on the Bezel after the protection film is peeled off.
(3) You can remove the glue easily. When the glue remains on the Bezel or its vestige is recognized,
please wipe them off with absorbent cotton waste or other soft material like chamois soaked with
normal-hexane.
