1. General Description

This specification applies to the 31.51 inch Color TFT-LCD Module T315XW02 VL. This LCD module has a TFT active matrix type liquid crystal panel 1366x768 pixels, and diagonal size of 31.51 inch. This module supports 1366x768 XGA-WIDE mode (Non-interlace). Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 8-bit gray scale signal for each dot.
The T315XW02 VL has been designed to apply the 8-bit 1 channel LVDS interface method. It is intended to support displays where high brightness, wide viewing angle, high color saturation, and high color depth are very important.
The T315XW02 VL model is RoHS verified, which can be distinguished on panel label.

</tbody>
</table>

Note 1: Duration: 50 msec.

Note 2: Maximum Wet-Bulb should be 39°C and No condensation.

The relative humidity must not exceed 90% non-condensing at temperatures of 40°C or less. At temperatures greater than 40°C, the wet bulb temperature must not exceed 39°C.
3. Electrical Specification

The T315XW02 VL requires two power inputs. One is employed to power the LCD electronics and to drive the TFT array and liquid crystal. The second input power for the BLU, is to power inverter..

</tr>
</tbody>
</table>

Note:

1. The ripple voltage should be controlled under 10% of V_{cc}
2. V_{cc}=12.0V, f_{v} = 60Hz, f_{CLK}=81.5MHz , 25\degree C, Test Pattern : White Pattern
3. Measurement condition:
4. VCIM = 1.2V

5. The performance of the Lamp in LCM, for example life time or brightness, is extremely influenced by the characteristics of the DC-AC Inverter. So all the parameters of an inverter should be carefully designed so as not to produce too much leakage current from high-voltage output of the inverter. When you design or order the inverter, please make sure unwanted lighting caused by the mismatch of the lamp and the inverter (no lighting, flicker, etc) never occurs. When you confirm it, the LCD Assembly should be operated in the same condition as installed in your instrument.

6. Do not attach a conducting tape to lamp connecting wire. If the lamp wire attach to conducting tape, TFT-LCD Module have a low luminance and the inverter has abnormal action because leakage current occurs between lamp wire and conducting tape.

7. The relative humidity must not exceed 80% non-condensing at temperatures of 40°C or less. At temperatures greater than 40°C, the wet bulb temperature must not exceed 39°C. When operate at low temperatures, the brightness of CCFL will drop and the life time of CCFL will be reduced.

8. The measured data is without boost function

9. W/O boost function Lifetime is defined and judged for lamp when analog and PWM dimming are maximum values. With boost function Lifetime is defined and judged for lamp when boost function is high (3.3V).
### 3-2 Interface Connections
- Connector on Panel: FI-X30SSL-HF (Manufactured by JAE) or Equivalent
- Mating connector: FI-30C2L (Manufactured by JAE) or Equivalent

LVDS Clock

| Frequency       | Fclk (1/Tclk) | 60   | 80   | 85   | MHz  |

Vertical Frequency

| Frequency | Fv | 47  | 60  | 63  | Hz   |

Horizontal Frequency

| Frequency | Fh | 43  | 48  | 53  | kHz  |

Notes:
1.) Display position is specific by the rise of DE signal only. Horizontal display position is specified by the rising edge of 1st DCLK after the rise of 1st DE, is displayed on the left edge of the screen.
Vertical display position is specified by the rise of DE after a “Low” level period equivalent to eight times of horizontal period. The 1st data corresponding to one horizontal line after the rise the of 1st DE is displayed at the top line of screen.
3.) If a period of DE “High” is less than 1366 DCLK or less than 768 lines, the rest of the screen displays black.
4.) The display position does not fit to the screen if a period of DE “High” and the effective data period do not synchronize with each other.
3-4 Signal Timing Waveforms
### 3-5 Color Input Data Reference

The brightness of each primary color (red, green and blue) is based on the 8 bit gray scale data input for the color; the higher the binary input, the brighter the color. The table below provides a reference for color versus data input.

<table>

<tr>
<td>t6</td>
<td>Min. 300</td>
<td>Typ. -</td>
</tr>
<tr>
<td>t7</td>
<td>Min. 300</td>
<td>Typ. -</td>
</tr>
</tbody>
</table>

Note:

The timing controller will not be damaged in case of TV set AC input power suddenly shut down.

Once power reset, it should follow power sequence as spec. definition.

(1) Apply the lamp voltage within the LCD operation range. When the back-light turns on before the LCD operation or the LCD turns off before the back-light turns off, the display may momentarily become abnormal screen.
3.6.2 Power Sequence for Inverter

![Diagram of power sequence](chart)

<tr>
<td>T6</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Note:

In case of t3=200ms, uniformity and optical performance are not guaranteed. But it will not damage power supplier and inverter.

In case of t7=1000ms, inverter operation is guaranteed. But brightness control depends on lamp response time.
4. Optical Specification

Optical characteristics are determined after the unit has been ‘ON’ and stable for approximately 45 minutes in a dark environment at 25°C. The values specified are at an approximate distance 50cm from the LCD surface at a viewing angle of $\Phi$ and $\theta$ equal to 0°.

Fig.1 presents additional information concerning the measurement equipment and method.

Note:
1. Contrast Ratio (CR) is defined mathematically as:

\[
\text{Contrast Ratio} = \frac{\text{Surface Luminance of } L_{\text{on1}}}{\text{Surface Luminance of } L_{\text{off1}}}
\]

2. Surface luminance is luminance value at point 1 across the LCD surface 50cm from the surface with all pixels displaying white. From more information see FIG 2. When VDD = 24V, IDDB = 5A.  \(L_{\text{WH}}=L_{\text{on1}}\)

Where Lon1 is the luminance with all pixels displaying white at center 1 location.
3. The variation in surface luminance, \(\delta\text{WHITE}\) is defined (center of Screen) as:

\[
\delta\text{WHITE}(5\%) = \frac{\text{Maximum}(L_{\text{on1}}, L_{\text{on2}}, \ldots L_{\text{on9}})}{\text{Minimum}(L_{\text{on1}}, L_{\text{on2}}, \ldots L_{\text{on9}})}
\]

4. Response time is the time required for the display to transition from black to white (Ton) and from white to black (Toff). For additional information see FIG3.

5. Response time \(T_{\gamma}\) is the average time required for display transition by switching the input signal for five luminance ratio (0%, 25%, 50%, 75%, 100% brightness matrix) and is based on \(f_s=60Hz\) to optimize.

6. View angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface.

For more information see FIG4.

FIG. 2 Luminance
**FIG.3 Response Time**

The response time is defined as the following figure and shall be measured by switching the input signal for “any level of gray(bright)” and “any level of gray(dark)”.

**FIG.4 Viewing angle**
5. Mechanical Characteristics

The contents provide general mechanical characteristics for the model T315XW02 VL. In addition the figures in the next page are detailed mechanical drawing of the LCD.

9. PRECAUTIONS

Please pay attention to the followings when you use this TFT LCD module.

9-1 MOUNTING PRECAUTIONS

(1) You must mount a module using holes arranged in four corners or four sides.
(2) You should consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
(3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to resist external force.
(4) You should adopt radiation structure to satisfy the temperature specification.
(5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
(6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics is detrimental to the polarizer.)
(7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front/ rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
(8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
(9) Do not open the case because inside circuits do not have sufficient strength.

9-2 OPERATING PRECAUTIONS

(1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage:
   $V=±200mV$ (Over and under shoot voltage)
(2) Response time depends on the temperature. (In lower temperature, it becomes longer.)
(3) Brightness depends on the temperature. (In lower temperature, it becomes lower.) And in lower temperature, response time (required time that brightness is stable after turned on) becomes longer.
(4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
(5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
(6) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimize the interface.
9-3 ELECTROSTATIC DISCHARGE CONTROL
Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wrist band etc. And don’t touch interface pin directly.

9-4 PRECAUTIONS FOR STRONG LIGHT EXPOSURE
Strong light exposure causes degradation of polarizer and color filter.

9-5 STORAGE +
When storing modules as spares for a long time, the following precautions are necessary.
(1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
(2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.

9-6 HANDLING PRECAUTIONS FOR PROTECTION FILM
(1) The protection film is attached to the bezel with a small masking tape. When the protection film is peeled off, static electricity is generated between the film and polarizer. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
(2) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of flue still on the Bezel after the protection film is peeled off.
(3) You can remove the glue easily. When the glue remains on the Bezel or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.
