### 3.2 BACKLIGHT UNIT

Ta = 25 ± 2 °C

Parameter	Symbol	Value			Unit	Note
		Min.	Typ.	Max.		
Lamp Input Voltage	V <sub>L</sub>	697	775	835	V <sub>RMS</sub>	(I <sub>L</sub> = 7.0 mA)
Lamp Current	I <sub>L</sub>	2.0	7.0	7.5	mA <sub>RMS</sub>	(1)
Lamp Turn On Voltage	V <sub>S</sub>	--	--	1500(25°C)	V <sub>RMS</sub>	(2)
		--	--	1710(0°C)	V <sub>RMS</sub>	(2)
Operating Frequency	F <sub>L</sub>	45	--	80	KHz	(3)
Lamp Life Time	L <sub>BL</sub>	40000	--	--	Hrs	(5)
Power Consumption	P <sub>L</sub>	--	21.73	--	W	(4), (I <sub>L</sub> = 7.0mA)

Note (1) Lamp current is measured by utilizing high frequency current meters as shown below:

Note (2) The voltage that must be larger than V<sub>S</sub> should be applied to the lamp for more than 1 second after startup. Otherwise the lamp may not be turned on.

Note (3) The lamp frequency may produce interference with horizontal synchronous frequency from the display, and this may cause line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible.

Note (4)  $P_L = I_L \times V_L \times 4$  CCFLs

Note (5) The lifetime of lamp can be defined as the time in which it continues to operate under the condition Ta = 25 ± 2 °C and I<sub>L</sub> = 7.0 mA<sub>RMS</sub> until one of the following events occurs:

- (a) When the brightness becomes or lower than 50% of its original value.
- (b) When the effective ignition length becomes or lower than 80% of its original value. (Effective ignition length is defined as an area that has less than 70% brightness compared to the brightness in the center point.)

Note (6) The waveform of the voltage output of inverter must be area-symmetric and the design of the inverter must have specifications for the modularized lamp. The performance of the Backlight, such as lifetime or brightness, is greatly influenced by the characteristics of the DC-AC inverter for the lamp. All the parameters of an inverter should be carefully designed to avoid producing too much current leakage from high voltage output of the inverter. When designing or ordering the inverter please make sure that a poor lighting caused by the mismatch of the Backlight and the inverter (miss-lighting, flicker, etc.) never occurs. If the above situation is confirmed, the module should be operated in the same manners when it is installed in your instrument.

The output of the inverter must have symmetrical (negative and positive) voltage waveform and symmetrical current waveform. (Asymmetrical ratio is less than 10%) Please do not use the inverter which has asymmetrical voltage and asymmetrical current and spike wave. Lamp frequency may produce interface with horizontal synchronous frequency and as a result this may cause beat on the display. Therefore lamp frequency shall be as away possible from the horizontal synchronous frequency and from its harmonics in order to prevent interference.

Requirements for a system inverter design, which is intended to have a better display performance, a better power efficiency and a more reliable lamp. It shall help increase the lamp lifetime and reduce its leakage current.

- a. The asymmetry rate of the inverter waveform should be 10% below;
- b. The distortion rate of the waveform should be within  $\sqrt{2} \pm 10\%$ ;
- c. The ideal sine wave form shall be symmetric in positive and negative polarities.

\* Asymmetry rate:

$$|I_p - I_{-p}| / I_{rms} * 100\%$$

\* Distortion rate

$$I_p \text{ (or } I_{-p}) / I_{rms}$$

Note: Because this module is operated by DE only mode, Hsync and Vsync input signals should be set to low logic level or ground. Otherwise, this module would operate abnormally.

### INPUT SIGNAL TIMING DIAGRAM

## 6.2 POWER ON/OFF SEQUENCE

To prevent a latch-up or DC operation of LCD module, the power on/off sequence should be as the diagram below.

Note.

- (1) The supply voltage of the external system for the module input should be the same as the definition of Vcc.
- (2) Please apply the lamp voltage within the LCD operation range. When the backlight turns on before the LCD operation of the LCD turns off, the display may, instantly, function abnormally.
- (3) In case of VCC = off level, please keep the level of input signals on the low or keep a high impedance.
- (4) T4 should be measured after the module has been fully discharged between power of and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{255} / L_0$$

L255: Luminance of gray level 255

L 0: Luminance of gray level 0

$$\text{CR} = \text{CR (7)}$$

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time ( $T_R, T_F$ ):

Note (4) Definition of Luminance of White ( $L_C$ ):

Measure the luminance of gray level 255 at center point

$$L_C = L(7)$$

$L(x)$  is corresponding to the luminance of the point X at Figure in Note (6).

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

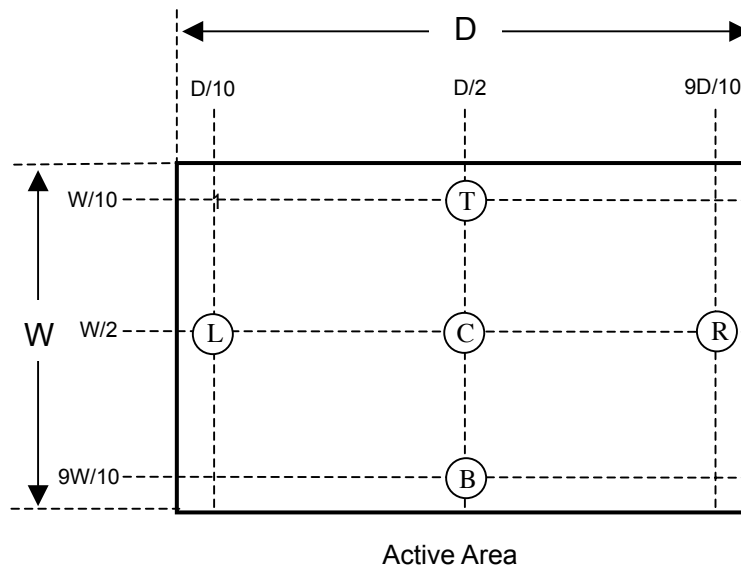

Note (6) Definition of White Variation ( $\delta W$ ):

Measure the luminance of gray level 255 at 13 points

$$\delta W = \text{Maximum} [L(1), L(2) \dots L(12), L(13)] / \text{Minimum} [L(1), L(2) \dots L(12), L(13)]$$

Note (7) Definition of Luminance Uniformity – Angular dependent :

Luminance is measured at the center measurement position “C” on the LCD panel. The optical axis of meter shall be aligned with the normal of the panel surface. The measuring distance between the meter and the surface of the panel is defined as:

$$Md \text{ (cm)} = \text{diagonal of the panel (cm)} \times 1.5 \quad \text{with minimum distance 50 cm.}$$

a. Horizontal - mode

The LCD panel is then rotated to another azimuthal angle to  $-30^\circ$ ; and  $L_{\min, -30^\circ}$  and  $L_{\max, -30^\circ}$  are obtained by using the same procedure.

The Luminance Uniformity is calculated as follow:

$$((L_{\max, +30^\circ} / L_{\min, +30^\circ}) + (L_{\max, -30^\circ} / L_{\min, -30^\circ})) / 2.$$

b. Vertical - mode

The LCD panel is then rotated to another azimuthal angle to  $-15^\circ$ ; and  $L_{\min, -15^\circ}$  and  $L_{\max, -15^\circ}$  are obtained by using the same procedure.

The Luminance Uniformity is calculated as follow:

$$L_{\max, +15^\circ} / L_{\min, +15^\circ}$$

$$L_{\max, -15^\circ} / L_{\min, -15^\circ}$$

The largest value shall be reported.

Note (8) Definition of Luminance Contrast – Angular dependent :

Active Area

Luminance contrast is measured at the center point of the LCD panel "C" along with the normal of the display with the same distance described in Note 7. The display is then rotated around the vertical axis by changing its azimuthal axis to  $+30^\circ$ ; and this gives:

$L_{255 \text{ G.L.}, +30^\circ}$  and  $L_{0 \text{ G.L.}, +30^\circ}$ .

The LCD panel is then rotated to azimuthal angle to  $-30^\circ$ ; and  $L_{0 \text{ G.L.}, -30^\circ}$  and  $L_{63 \text{ G.L.}, -30^\circ}$  are obtained by using the same procedure. The Luminance Contrast is calculated:

$$(L_{255 \text{ G.L.}, -30^\circ} - L_{0 \text{ G.L.}, -30^\circ}) / (L_{255 \text{ G.L.}, -30^\circ} + L_{0 \text{ G.L.}, -30^\circ})$$

For both  $+30^\circ$  and  $-30^\circ$ . The lowest value shall be reported.

Note (9) Definition of Colour uniformity – Angular dependence :

From Note (7), it can measure the data as below chart.

	Measuring point R		Measuring point L		$\Delta u'v'$
	$u'_R$	$v'_R$	$u'_L$	$v'_L$	
$+30^\circ$					
$-30^\circ$					

$$\Delta u'v' = \sqrt{(u'_R - u'_L)^2 + (v'_R - v'_L)^2}$$

For both  $+30^\circ$  and  $-30^\circ$ . The largest value in  $\Delta u'v'$  shall be reported.

## 9. PRECAUTIONS

### 9.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) Do not apply rough force such as bending or twisting to the module during assembly.
- (2) To assemble or install module into user's system can be only in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- (3) It's not permitted to have pressure or impulse on the module because the LCD panel and Backlight will be damaged.
- (4) Always follow the correct power sequence when LCD module is connecting and operating. This can prevent damage to the CMOS LSI chips during latch-up.
- (5) Do not pull the I/F connector in or out while the module is operating.
- (6) Do not disassemble the module.
- (7) Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- (8) It is dangerous that moisture come into or contacted the LCD module, because moisture may damage LCD module when it is operating.
- (9) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (10) When ambient temperature is lower than 10°C may reduce the display quality. For example, the response time will become slowly, and the starting voltage of CCFL will be higher than room temperature.

### 9.2 SAFETY PRECAUTIONS

- (1) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with inverter. Do not disassemble the module or insert anything into the Backlight unit.
- (2) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- (3) After the module's end of life, it is not harmful in case of normal operation and storage.
