Color coordinate and color gamut are measured by SRUL1R, response time is measured by TRD-100, and all the other items are measured by BM-5A (TOPCON). All these items are measured under the dark room condition (no ambient light).

Measurement Condition: IL=19 mA(each LED)

Definition of these measurement items is as follows:

***1) Setup of Measurement Equipment**

The LCD module should be turn-on to a stable luminance level to be reached. The measurement should be executed after lighting Backlight for 20 minutes and in a dark room.

***2) Definition of Contrast Ratio**

CR=ON (White) Luminance/OFF (Black) Luminance

***3) Definition of Luminance and Luminance uniformity**

Central luminance: The white luminance is measured at the center position “1” on the screen, see Fig below.

5P Luminance (AVG): The white luminance is measured at measuring points 1~5 see Fig below.

9P Uniformity: $\Delta L = (L_{min} / L_{max}) \times 100\%$ at measuring points 1 & 6~13 see fig below.

*4) Definition of view angle(θ , ψ)

*5) Definition of response time

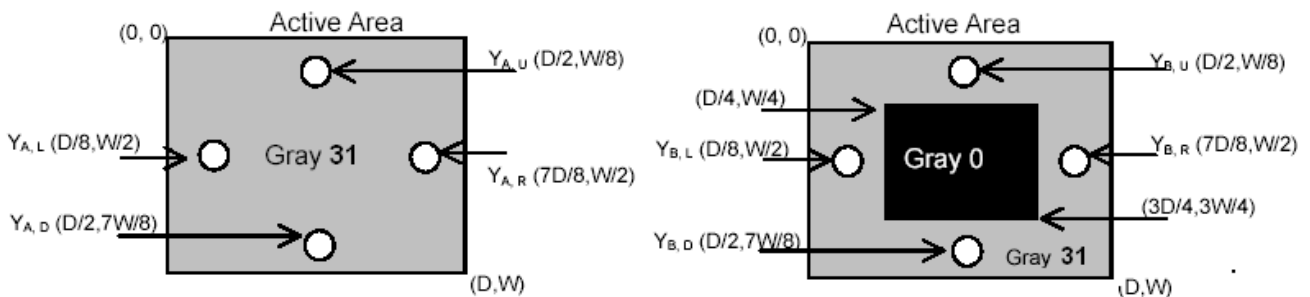

*6) Crosstalk Modulation Ratio:

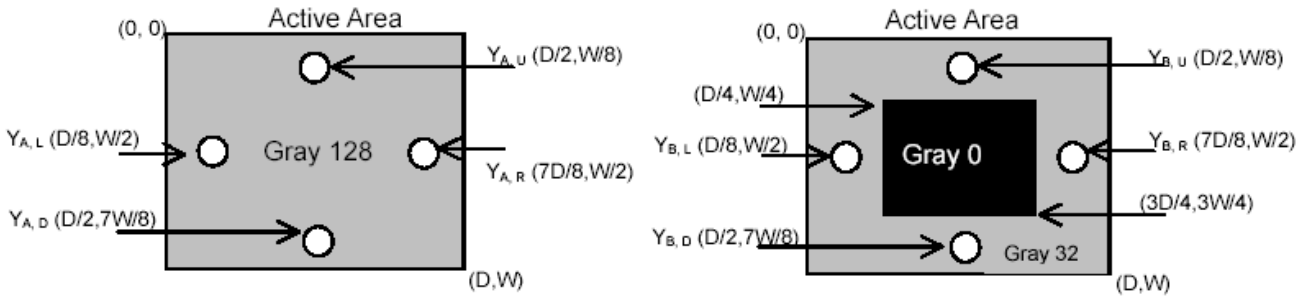

$$CT = | Y_B - Y_A | / Y_{Ax} \times 100\%$$

Y_A , Y_B measure position and definition

Y_A means luminance at gray level 31(exclude gray level 0 pattern)

Y_B means luminance at gray level 31(include gray level 0 pattern)

***7) Definition Gamma (VESA)**

Based on Customer Sample, take the average value as a standard center value and the variation range of gamma value caused by loop voltage error should be between +/- 0.2. the bellow figure shows how to obtain the gamma curve and γ (from gray level: 0、4、8-----60、63).
