Remark(1): There are two functions, brightness and contrast tuning, to let luminance to 125cd/m2 in OSD. OSD shouldn't restrict the panel's G-T curve for brightness to be 125cd/m2. The higher contrast, the higher angular uniformity. That is to say, if OSD want to tune the panel's luminance to 125 cd/m2, the suitable way is to only tune the brightness function. And if tuning the brightness function to 125 cd/m2, it would be better only to tuning the inverter, not the gray level.

## 6.2 Back-Light Unit

The back-light system is an edge-lighting type with 4 CCFL (Cold Cathode Fluorescent Lamp).  
The characteristics of the lamp are shown in the following tables.

Item	Symbol	Min.	Typ.	Max.	Unit	Note
Lamp current	IL	3.0	7.5	8.0	mA(rms)	(1)
Lamp voltage	VL	594	660	726	V(rms)	$I_L=7.5\text{mA}$
Frequency	fL	40	50	80	KHz	(2)
Operating Lifetime	Hr	40,000	--	--	Hour	7.5mA(3)
Startup voltage	Vs	1400	--	--	V(rms)	at 25°C
		1650				at 0°C

### Note (1)

Lamp current is measured with current meter for high frequency as shown below. Specified values are for a single lamp. To exceed 7.5 mA, life time accelerate drop down and if to exceed 9.0 mA has safety problem. If current lower than 3.5 mA, CCFL would be unstable or damaged.

### Note (2)

Lamp frequency may produce interference with horizontal synchronous frequency and this may cause ripple noise on the display. Therefore lamp frequency shall be kept away from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.

### Note (3)

Lamp life time (Hr) can be defined as the time in which it continues to operate under the condition :  $T_a=25\pm3^\circ\text{C}$ , Typical IL value indicated in the above table and  $f_L=48\text{ kHz}$  until the brightness becomes less than 50%

### Note (4)

CCFL inverter should be able to provide a voltage over specified value (Vs) in the above table. Lamp units need at least Vs value shown above to ignition.

Document Title	HSD190MEN3 Formal Standard Specification	Page No.	19 / 34
Document No.		Revision	1.0

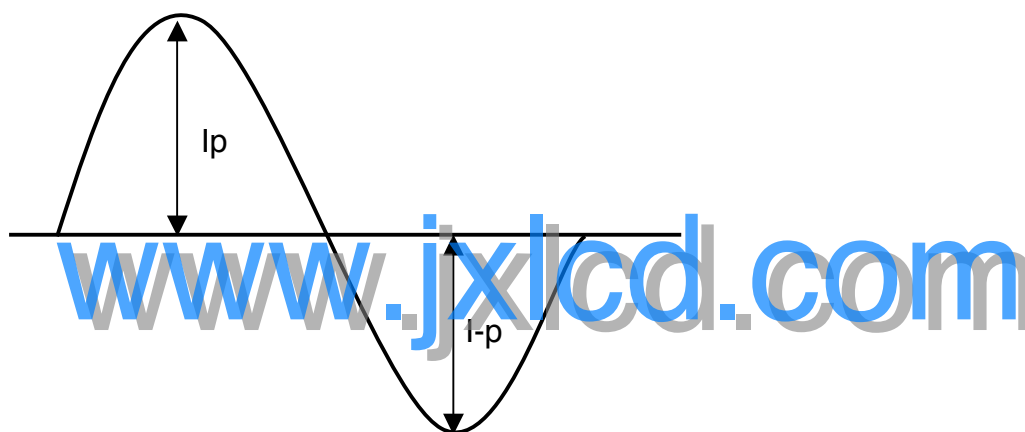

#### Note (5)

The voltage over specified value ( $V_s$ ) should be applied to the lamp more than 1 second after startup. Otherwise, the lamp may not be turned on. The used lamp current is the lamp typical current.

#### Note (6)

The output voltage waveform and current waveform of the inverter must be symmetrical (Unsymmetrical ratio is less than 10%). Please do not use the inverter which has unsymmetrical voltage and current waveform, and spike waveform. The inverter design which can provide the best optical performance, power efficiency, and lamp life should under the following conditions.

- The asymmetry rate of the inverter waveform should be less than 10%.
- The distortion rate of the waveform should be within  $\sqrt{2} \pm 10\%$ .
- The inverter output waveform should be better similar to the ideal sine wave.

$$\text{Asymmetry rate} = \frac{|I_p - I_{-p}|}{I_{rms}} \times 100\%$$

$$\text{Distortion rate} = \frac{I_p \text{ (or } I_{-p})}{I_{rms}}$$

#### Note (7)

The frequency range from 50 to 60KHz can guarantee both electrical and optical characteristics. The frequency range from 40 to 80KHz will not effect the characteristics of lifetime and reliability.

- (2) Apply the lamp voltage within the LCD operation range. When the back-light turns on before the LCD operation or the LCD turns off before the back-light turns off, the display may momentarily become white.
- (3) In case of V<sub>DD</sub> = off level, please keep the level of input signal on the low or keep a high impedance.
- (4) TP4 should be measured after the module has been fully discharged between power off and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.

## 10.0 GENERAL PRECAUTION

### 10.1 Use Restriction

This product is not authorized for use in life supporting systems, aircraft navigation control systems, military systems and any other application where performance failure could be life-threatening or otherwise catastrophic.

### 10.2 Disassembling or Modification

Do not disassemble or modify the module. It may damage sensitive parts inside LCD module, and may cause scratches or dust on the display. HannStar does not warrant the module, if customers disassemble or modify the module.

### 10.3 Breakage of LCD Panel

10.3.1 If LCD panel is broken and liquid crystal spills out, do not ingest or inhale liquid crystal, and do not contact liquid crystal with skin.

10.3.2 If liquid crystal contacts mouth or eyes, rinse out with water immediately.

10.3.3 If liquid crystal contacts skin or cloths, wash it off immediately with alcohol and rinse thoroughly with water.

10.3.4 Handle carefully with chips of glass that may cause injury, when the glass is broken.

### 10.4 Electric Shock

10.4.1 Disconnect power supply before handling LCD module.

10.4.2 Do not pull or fold the CCFL cable.

10.4.3 Do not touch the parts inside LCD modules and the fluorescent lamp's connector or cables in order to prevent electric shock.

### 10.5 Absolute Maximum Ratings and Power Protection Circuit

10.5.1 Do not exceed the absolute maximum rating values, such as the supply voltage variation, input voltage variation, variation in parts' parameters, environmental temperature, etc., otherwise LCD module may be damaged.

10.5.2 Please do not leave LCD module in the environment of high humidity and high temperature for a long time.

10.5.3 It's recommended employing protection circuit for power supply.

### 10.6 Operation

10.6.1 Do not touch, push or rub the polarizer with anything harder than HB pencil lead.

Use fingerstalls of soft gloves in order to keep clean display quality, when persons handle the LCD module for incoming inspection or assembly.

10.6.2 When the surface is dusty, please wipe gently with absorbent cotton or other soft material.

10.6.3 Wipe off saliva or water drops as soon as possible. If saliva or water drops contact with polarizer for a long time, they may causes deformation or color fading.

11.6.4 When cleaning the adhesives, please use absorbent cotton wetted with a little petroleum benzene or other adequate solvent.

Document No.		Revision	1.0

## 10.7 Mechanism

Please mount LCD module by using mounting holes arranged in four corners tightly.

## 10.8 Static Electricity

10.8.1 Protection film must remove very slowly from the surface of LCD module to prevent from electrostatic occurrence.

10.8.2 Because LCD module uses CMOS-IC on circuit board and TFT-LCD panel, it is very weak to electrostatic discharge. Please be careful with electrostatic discharge.

10.8.3 Persons who handle the module should be grounded through adequate methods.

## 10.9 Strong Light Exposure

The module shall not be exposed under strong light such as direct sunlight. Otherwise, display characteristics may be changed.

## 10.10 Disposal

When disposing LCD module, obey the local environmental regulations.

Note (7) Definition of crosstalk CT (1) ~ CT (4)

$$CT(n) = \frac{|L(n) - LB(n)|}{L(n)} \times 100\%, n = 1 \sim 4$$

Where L(n) = Luminance of point “n” at pattern A (cd/m<sup>2</sup>) , n=1~4

LB(n) = Luminance of point “n” at pattern B (cd/m<sup>2</sup>) , n=1~4

The location measured will be exactly the same in both patterns.

L0: Luminance with all pixels black

L255: Luminance with all pixels white

The measurement sequence is to measure the values of the first point in two patterns (Pattern A => Pattern B) and then that of the second point in two patterns and so on. The measurement of the second point is allowed only after the values of the first point in two patterns are measured.

The measurement sequence: L(1) : Pattern A => Pattern B → L(2) : Pattern A => Pattern B → L(3) : Pattern A => Pattern B → L(4) : Pattern A => Pattern B
