General Description

This manual describes the Himax's HX8312-A 240RGB*320 dots resolution driving controller. The HX8312-A is designed to provide a single-chip solution that combined a gate driver, a source driver, power supply circuit, and internal graphics SRAM for 262,144 colors to drive a TFT panel with 240RGB*320 dots at maximum.

The HX8312-A can be operated in low-voltage (1.65V) condition to the interface and integrated internal boosters that produce the liquid crystal voltage, breeder resistance and the voltage follower circuit for liquid crystal driver. In addition, the HX8312-A also supports various functions to reduce the power consumption of a LCD system via software control, such as an standby mode and 8-color display mode. The HX8312-A has five system interfaces: an I80-system and M68-system 18-/16-/9-/8-bit bus interface, VSYNC interface(internal clock, DB17-0), serial data transfer interface and RGB18-/16-/6-bit bus interface(DOTCLK, VSYNC, HSYNC, ENABLE). In RGB interface and VSYNC interface mode, the combined use widow address function enables to display data in a moving picture area and data in internal RAM at once, which makes it possible to transfer display data only when rewriting a screen and minimize data transfers.

The HX8312-A is suitable for any small portable battery-driven product and requiring long-term driving capabilities, such as small PDAs, digital cellular phones and bi-directional pagers

Features

Single chip solution to drive a TFT panel

240RGB x 320-dot graphics display LCD controller/driver and 262,144 TFT colors

Support interface:

System interface

(I80 / M68) parallel bus system interface

Serial bus system interface

RGB interface

VSYNC interface

Internal graphics RAM capacity: 1,328,400 bytes

The 262,144 colors can be displayed at the same time with gamma correction

The vertical scroll display function in line units

Internal operation circuit of liquid crystal display:

Source channel: 720

Gate line: 320

To write data in a window-RAM address area by using a window address area access function

Low-power consumption architecture supports:

VCI = 2.5 to 3.3 V (internal reference voltage)

VCC = 2.2 to 3.3 V (corresponding low-voltage operation)

IOVCC = 1.65 to 3.3 V (Interface I/O operation)

VLCD=4.5~5.5V

Power-saving functions

- 8-color mode
- standby mode

N-line inversion AC liquid-crystal drive

Partial liquid crystal drive to display two screens at arbitrary positions

Internal oscillator and hardware / software reset function

1.2 Pin Description

Input Parts				
Signals	I/O	Pin Number	Connected with	Description
BWS2	I	1	MPU	The bus width selection in RGB interface circuit. 0: 18-bit, 1: 16-bit
BWS1-0		2	MPU	The bus width selection in system interface circuit. (see Table 2. 1)
PSX	I	1	MPU	The parallel and serial bus interface selection in system interface circuit. 0: Parallel bus interface, 1: Serial bus interface
NCS	I	1	MPU	Chip select signal. 0: chip can be accessed; 1: chip cannot be accessed.
NRESET	I	1	MPU	Reset pin. Setting either pin low initializes the LSI. Must be reset the chop after power being supplied.
NRD (E)	I	1	MPU	I80 system: Serves as a read signal and reads data at the low level. M68 system: 0: Read/Write disable ; 1: Read/Write enable Fix it to IOVCC or VSSD level when using serial buss interface.
NWR (RNW)	I	1	MPU	I80 system : serves as a write signal and writes data at the rising edge. M68 system: 0: Write ; 1: Read Serial bus interface: 0: Write ; 1: Read
C86	I	1	MPU	MPU selection 0: i80 series MPU; 1: M68 series MPU. Fix it to IOVCC or VSSD level when using serial bus interface.
SDI	I	1	MPU	Serial bus interface data input pin. Fix it to IOVCC or VSSD level when using parallel bus interface.
SCL	I	1	MPU	Serial bus interface clock input pin Fix it to IOVCC or VSSD level when using parallel bus interface.
RGB_nCPU	I	1	MPU	0: System interface can be accessed. 1: System interface can not be accessed.
RS	I	1	MPU	Command/display Data Selection 0: Command, 1: Display data
DTX2-1	I	2	MPU	Specify the transferring method of one pixel data in system interface. (see Table 2. 3)
SCLEG1-0	I	1	MPU	Determine the effective edge operation of SCLK for SDI data latch and SDO data output. (see Table 2. 6)
VSYNC	I	1	MPU	Vertical synchronization signal input pin. Must be connected to IOVCC if not in use.
H SYNC	I	1	MPU	Horizontal synchronization signal input pin. Must be connected to IOVCC if not in use.
DOTCLK	I	1	MPU	Dot clock signal input used in the RGB interface circuit. Must be connected to IOVCC if not in use.
ENABLE	I	1	MPU	Enable signal pin used in RGB interface circuit. 0: disable, 1: enable when EPL (D1 bit of R157) = 0. 0: enable, 1: disable when EPL (D1 bit of R157) = 1. Must be connected to IOVCC if not in use.
VSEG	I	1	MPU	Valid VSYNC polarity selection pin 0: Start in the low level, 1: Start in the high level Fix it to IOVCC or VSSD level when only using system interface.
HSEG	I	1	MPU	Valid HSYNC polarity selection pin 0: Start in the low level, 1: Start in the high level. Fix it to IOVCC or VSSD level when only using system interface.
DCKEG	I	1	MPU	Valid DOTCLK polarity selection pin 0: chip latch data at falling edge. 1: Chip latch data at rising edge. Fix it to IOVCC or VSSD level when only using system interface.
DDS	I	1	MPU	Selection the position of dummy line (321st line). 0: the end of the frame, 1: the beginning of the frame

Output Part				
Signals	I/O	Pin Number	Connected with	Description
SDO	O	1	MPU	Serial bus interface data output pin. Keep it open while using parallel bus interface
CSTB	O	1	MPU	Frame synchronization signal output pin. Keep it open if not in use.
S1~S720	O	720	LCD	Source driver output pin. Output voltages to the liquid crystal.
G1~G321	O	321	LCD	Output signals to panel gate lines. VGH: the level to select the gate lines VGL: the level not to select the gate lines
VCOM1~4	O	4	LCD	VCOM output pin. They are short-circuited inside HX8312-A.

Input/Output Part				
Signals	I/O	Pin Number	Connected with	Description
DB17-0	I/O	18	MPU	Operates like an 18-bit bi-directional data bus. Fix it to IOVCC or VSSD level when using serial bus interface. Don't set MPU output as Hi-Z when MPU has no output.
OSC2-1	I/O	2	Oscillation Resistor	Connect an external resistor for generating internal clock by internal R-C oscillation. Or an external clock signal is supplied through OSC1 with OSC2 open.
C11A , C11B CX11A , CX11B	I/O	4	Step up Capacitor	Connect to the step-up capacitors for step up circuit 1 operation. Leave this pin open if the internal step-up circuit is not used.
C21A , C21B C22A , C22B C23A , C23B	I/O	6	Step up Capacitor	Connect to the step-up capacitors for step up circuit 2 operation. Leave this pin open if the internal step-up circuit is not used.
C12A , C12B	I/O	2	Step up Capacitor	Connect to the step-up capacitors for step up circuit 3 operation. Leave this pin open if the internal step-up circuit is not used.

Power Part				
Signals	I/O	Pin Number	Connected with	Description
VCC	I	1	Power supply	A power supply for the internal logic circuit. VCC = 2.2 ~ 3.3V
VCI	I	1	Power supply	A Power supply for step-up circuit and power supply circuit. VCI = 2.5 ~ 3.3V
IOVCC	I	1	Power supply	Power supply for I/O circuit. IOVCC = 1.65 ~ 3.3V
V18	O	1	Bypass capacitor and VDDD, RVCC	1.8V regulator output. V18, VDDD and RVCC must have the same voltage level. Connect to VDDD and RVCC on the FPC.
RVCC	I	1	V18 and VDDD	Power supply for RAM circuit.
VDDD	I	1	V18 and RVCC	Power supply for logic circuit.
VSSD	I	1	System Ground	Ground for digital circuit.
VSSD2	I	1	System Ground	Ground for internal circuit.
VSSA	I	1	System Ground	Ground for analog circuit.
VGH	O	1	Bypass Capacitor	A positive power supply for the gate line drive circuit.
VGL	O	1	Bypass Capacitor Schottky Diode	A negative power supply for the gate line drive circuit. Insert a schottky diode in a forward direction to VSSA.
ADDVDH	I	1	DDVDH	Power supply pins for VS and COMH regulators. Connected to DDVDH on FPC
DDVDH	O	1	ADDVDH and Bypass Capacitor	Output supply pin. Connected to ADVDDH on FPC.
VCL	O	1	Bypass Capacitor	The voltage of Vci x (-1) output
VR2-1	O	2	Bypass Capacitor	Reference voltage output for the step-up circuit 2.
VS	O	1	Bypass Capacitor	Power supply for the source drive unit.
VGLDMY	O	1	-	A negative power supply for the gate line drive circuit.

Power Part				
Signals	I/O	Pin Number	Connected with	Description
VCOMH	O	1	Bypass Capacitor	The high level voltage output of VCOM AC voltage output.
VCOML	O	1	Bypass Capacitor	The low level voltage output of VCOM AC voltage output. When VCOML is fixed to GND level (VCOMG=0), capacitor connection is not necessary.
VGS	I	1	GND or External R	A reference level for the grayscale voltage generating circuit.
VCOMR	I	1	Variable Resistor	Adjusting VCOMH level with an variable resistor between VDH and VSSA.
IOVCCDUM1~8	O	8	-	Pull-up pin for mode setting. These pins are connected to IOVCC inside the chip.
IOGNDDUM1~9	O	9	-	Pull-down pin for mode setting. These pins are connected to VSSD inside the chip.

Test Pin and Others				
Signals	I/O	Pin Number	Connected with	Description
TEST2-1	I	2	GND	Test pin input. Must connect to VSSD.
DS1	O	1	-	Pin for gamma voltage output
VMON	O	1	-	Test pin output. Must be left open.
TESTA1, 2, 4	O	3	-	Test pin output. Must be left open.
THROUGH1	-	1	-	Dummy pads. Used to measure the COG contact resistance.
THROUGH8	-	1	-	THROUGH1 and THROUGH8 are short-circuited within the chip.
THROUGH2	-	1	-	Dummy pads. Used to measure the COG contact resistance.
THROUGH7	-	1	-	THROUGH2 and THROUGH7 are short-circuited within the chip.
THROUGH3	-	1	-	Dummy pads. Used to measure the COG contact resistance.
THROUGH6	-	1	-	THROUGH3 and THROUGH6 are short-circuited within the chip.
THROUGH4	-	1	-	Dummy pads. Used to measure the COG contact resistance.
THROUGH5	-	1	-	THROUGH4 and THROUGH5 are short-circuited within the chip.
DUMMYR1	-	1	-	Dummy pads. Used to measure the COG contact resistance.
DUMMYR2	-	1	-	DUMMYR1 and DUMMYR2 are short-circuited within the chip.
DUMMY 1-14, 16, 18, 20-50	-	47	-	Dummy pin. (There is no gold bumper on DUMMY 7,9,11, 23, 25 ,27)

Note : 1. The layout of VSSA , VSSD , VSSD2 need to be separated in panel, and short together in FPC.

2. The short connection of TEST1, TEST2 and VSSD must be located in FPC, not in panel.

3. Input pin must be fixed to VCC or VSSD when no use.

4. The output pin must be left floating when no use.

5. SDO is a output pin. It must be left floating when no use.

6. TEST2 , 1 are test pin inputs. It must be connected to VSSD

7. DS1, MON , TESTA1, 2, 4 are test pin outputs. It must be left floating.

2. Interface

The HX8312-A has a system interface circuit for data / command transferring, and a RGB interface circuit for data transferring during animated display. The system interface circuit uses data bus pins (DB17-0) defined as (R5-0, G5-0, B5-0) bits. Since the data bus pins (DB17-0) can be used as input in RGB interface circuit, the HX8312-A shows animated display with less wiring. Table 2. 1 shows the bus pin used in every interface circuit with different external setting pin setting.

When HX8312-A is set up for unique interface mode, the input data bus pins which are not used must be fixed at IOVCC or VSSD.

Table 2. 1 Interface Type

Note:

1. The NWRGB is the D0 bit of R02h register.
2. System interface (parallel and serial bus) circuit is not available when external pin RGB_nCPU = "1". All operation from system interface input are not available.
3. Please make sure that RGB interface circuit is only used for display data RAM accessed, and can not be used for register accessed.

2.1 System Interface Circuit

The system interface circuit in HX8312-A supports 18-/16-/8-bit bus width parallel bus system interface for I80 series and M68 series CPU, and 18-/16-bit serial bus system interface for serial data input. When NCS = "L" and RGB_nCPU = "L", the parallel and serial bus system interface of the HX8312-A become active and data transfer through the interface circuit is available. The RS pin specifies whether the system interface circuit access is to the register command or to the display data RAM. The input bus format of system interface circuit is selected by external pins setting. For selecting the input bus format, please refer to Table 2. 2, 2. 3.

2.1.2 Serial Bus System Interface

The HX8312-A supports the 18/16-bit serial bus system interface. The serial bus interface mode is enabled through the chip select input (NCS), and accessed via a three-wire control pin consisting of the serial input data (SDI), serial output data (SDO), and the serial transfer clock (SCL). The selection of read / write operation is made by NWR(RNW) pin, and the RS pin specifies whether the access is to the register command or to the display data RAM. Please remember to complete one data transfer operation by the 16-clock SCLK input when the 16-bit serial interface is in use, and by the 18-clock SCLK input when 18-bit serial interface is in use.

When the serial bus interface is in use, the external pins SCLEG1-0 setting determine the effective edge operation of SCLK for SDI data latch and SDO data output. Please refer to Table 2. 6 and Figure 2. 7.

SCLEG1	SCLEG0	Active level of SCLK	Latch Timing of SDI	Output Timing of SDO
0	0	Low Level	Rising edge of SCLK	Falling edge of SCLK

2.1.3 Relation between Register Command Data Format and Input Bus

The RS pin specifies whether the access is to the register command or to the display data RAM. The input data for register command is consist of 16 bits. The upper 8 bits (D15-8) are address and the lower 8 bits (D7-0) are data.

2.1.4 Relation between Display RAM Data Format and Input Bus in System Interface

The display RAM data is consist of 18 bits which include R-, G-, B-dot display level information. The (D17-12) bits are R-dot display level (D17 is MSB); (D11-6) bits are G-dot display level (D11 is MSB) ; (D5-0) bits are B-dot display level (D5 is MSB).

(6) MPU6 Type (8-bit + 8-bit + 2-bit)

(7) MPU7 Type (8-bit × 2)

In the MPU7 type, The 16-bit data written to display RAM is expanded to 18-bit bus data automatically in the LSI. D12 of the display data RAM is compensated by the data from DB7 in the first transfer and D0 of the display data RAM is compensated by the data from DB4 in the second transfer.

(8) MPU8 Type (18-bit serial)

(9) MPU9 Type (16-bit serial)

In the MPU9 type, The 16-bit data written to display RAM is expanded to 18-bit bus data automatically in the LSI. D12 of the display data RAM is compensated by the data from S15 and D0 of the display data RAM is compensated by the data from S4 in the transfer.

2.2 RGB Interface Circuit

The HX8312-A has the RGB interface circuit for animated display data written. RGB25-20, RGB15-10, RGB05-00 input pins are used for RGB interface circuit via data pins (DB17-0). When using the RGB interface circuit to update display RAM, please make sure to set NWRGB (D0 bit of R2) as "1". Please make sure that register of LSI can not be accessed via RGB interface circuit.

When the data pins (DB17-0) are used for the RGB interface circuit, the bit allocation is as below.

Data Pins	RGB Pins
DB17-12	RGB25-20
DB11-6	RGB15-10
DB5-0	RGB05-00

Table 2. 7 Bit allocation when DB17-0 used for RGB interface circuit

The input bus format of RGB interface circuit is selected by external pin BWS2 and MSBF (D0 bit of R157) setting. For selecting the input bus format, please refer to Table 2. 8.

Interface Type	External Pin	Register	Interface Mode	Number of data per pixel	Transferring method of one pixel data
					BWS2
RGB1	0	0	18-bit	18 bits	18-bit collective

2.2.1 Relation between Display RAM Data Format and Input Bus

The following shows the relation between display RAM data allocation and input data bus in different RGB type input data format.

(1)RGB1 Type

(2)RGB2 Type

In the RGB2 type, The 16-bit data written to display RAM is expanded to 18-bit bus data automatically in the LSI. D12 of the display data RAM is compensated by the data from RGB23 and RGB04 of the display data RAM is compensated by the data from DB4 in the transfer.

3. Input and Synchronized Display Modes

The HX8312-A has three writing mode for display data input. Three writing modes are as follow :

- (1)**Through Mode:** In through mode, input display data via RGB interface circuit is not written to display RAM and is displayed directly.
- (2)**Capture Mode:** In capture mode, display data is written to display RAM via RGB interface circuit and displayed.
- (3)**Override Mode:** In override mode, RGB pins are not available, and input display data via system interface circuit is written to display RAM and display.

Also, the HX8312-A has three synchronized display modes as listed below :

(1)Internally Synchronized Display Mode:

Display operation is synchronized with SYSCLK generated by internal oscillator.

(2)Externally Synchronized Display Mode:

Display operation is synchronized with external VSYNC, HSYNC, DOTCLK signal input.

(3)VSYNC Interface Display Mode:

Display operation is synchronized with SYSCLK and external VSYNC signal input.

Table 3. 1 shows the combinations of these modes. One out of these six modes is available by setting D4, D2, D1, D0 bits of the RGB interface register (R2). See the sections (3.1 - 3.3) for more details. When a mode is changed to another mode, HX8312-A can display correct pictures after finishing displaying the present frame.

Register R2				RGB Mode	Used Interface Circuit	Signal used to display RAM write	Display Operation

3.1 The Operation of Each Mode

3.1.1 Externally synchronized display mode + through mode

As Table 3. 1 shows, the HX8312-A enters "externally synchronized mode + through mode" by setting D4, D2, D1 and D0 bits of the RGB interface register (R2) as "0111". In this mode, display data is displayed in synchronization with VSYNC, HSYNC and DOTCLK , and the display data of display area defined by RGB start register 1 (R60), RGB start register 2 (R61), RGB end register 1 (R62) and RGB end register 2 (R63), is inputted via RGB interface circuit without being written to the display RAM and display directly. The display data in the display RAM outside the display area defined by R60-R63 is not updated in this mode so the same display data is displayed. NWRGB(D0 bit of R2) must be set to "0" when it is necessary to update display RAM data outside the display area defined by R60-R63, and then display data must be inputted via system interface pins.

In this mode, the vertical back porch register VBP4-0 (D4-0 of R65) needs to be set the value the same as vertical back porch of input signal. The horizontal back porch register HBP4-0 (D4-0 of R64) needs to be set the value the same as (horizontal back porch-2) of input signal. See Figure 3. 1.

Figure 3. 1 Display example in the externally synchronized display mode + through mode

Figure 3. 2 Display and Input Timing of the externally synchronized display mode + through Mode (VSEG = "0", HSEG = "0", DCKEG = "0", EPL = "0")

3.1.2 Externally synchronized display mode + capture mode

As Table 3. 1 shows, by setting D4, D2, D1 and D0 bits of the RGB interface register (R2) as "0011", the HX8312-A enters "externally synchronized mode + capture mode". In this mode, display data is written to the display RAM via RGB interface first and then displayed in synchronization with VSYNC, HSYNC and DOTCLK by reading the display data from the display RAM in the same frame. As in Figure 3. 3, the captured area can be determined by the window area access mode. (See the "4.3 Window Address Area Access" section.) or full screen display. The display data in the display RAM outside the display area defined by window access register is not updated in this mode so the same display data is displayed. When it is necessary to update display RAM data outside the window access area, it needs to change window access area register.

In this mode, the vertical back porch register VBP4-0 (D4-0 of R65) needs to be set the value the same as vertical back porch of input signal. The horizontal back porch register HBP4-0 (D4-0 of R64) needs to be set the value the same as horizontal back porch of input signal. See Figure 3. 3.

Figure 3. 3 Display example in the externally synchronized display mode + capture mode

Figure 3.4 Display and Input Timing of the externally synchronized display mode + capture mode (VSEG = "0", HSEG = "0", DCKEG = "0", EPL = "0")

3.1.3 Internally synchronized display mode + capture mode

As Table 3. 1 shows, by setting D4, D2, D1 and D0 bits of the RGB interface register (R2) as "0001", the HX8312-A enters "internally synchronized mode + capture mode". In this mode, display data is written to the display data RAM via RGB interface circuit first and then displayed in synchronization with SYCLK (system clock signal generated by internal oscillator) by reading the display data from the display RAM to the panel. As in Figure 3. 3, the captured area are determined by the window access mode. (See the "4.3 Window Address Area Access Mode") The display data in the display RAM outside the display area defined by window access register is not updated in this mode so the same display data is displayed. When it is necessary to update display RAM data outside the window access area, it needs to change window access area register.

In this mode, 1-frame and 1-line period of display timing must be defined by internal SYCLK instead of VSYNC and HSYNC. In this mode, the vertical back porch register VBP4-0 (D4-0 of R65) needs to be set the value the same as vertical back porch of input signal. The horizontal back porch register HBP4-0 (D4-0 of R64) needs to be set the value the same as horizontal back porch of input signal.

3.1.4 Internally synchronized display mode + override mode

As Table 3. 1 shows, by setting D4, D2, D1 and D0 bits of the RGB interface register (R2) as "0000", the HX8312-A enters "internally synchronized mode + override mode". In this mode, display data is written to the display data RAM via system interface circuit first and then displayed in synchronization with SYCLK by reading the display data from the display RAM to panel.

In this mode, 1-frame and 1-line period of display timing must be defined by internal SYCLK instead of VSYNC and HSYNC.

3.1.5 Externally synchronized display mode + override mode

As Table 3. 1 shows, by setting D4, D2, D1 and D0 bits of the RGB interface register (R2) as "0010", the HX8312-A enters "Externally synchronized mode + override mode". In this mode, display data is written to the display data RAM via system interface circuit first and then displayed in synchronization with VSYNC, HSYNC, DOTCLK.

In this mode, the display blanking period is determined by the settings of the horizontal back porch register (R64) and the vertical back porch register (R65).

3.2 VSYNC Interface Mode

The HX8312-A supports the VSYNC interface mode, which can display animated displays with the system interface circuit and the frame synchronization signal VSYNC.

Figure 3.5 VSYNC Interface to MPU

By setting D4 = "1" (VMODE) and D3-D0="0000" of the RGB interface register (R2), the VSYNC interface becomes available. In the VSYNC interface mode, the internal display operation is synchronized with SYSCLK, however, the frame starting of display operation is determined by VSYNC. (Therefore, VSYNC signal needs always exist.)

In the VSYNC interface mode, writing of display data to the display RAM must be performed before outputting that pixel data in the same allocation of RAM for smooth animation display. Therefore, the VSYNC interface has some constraints in the internal clock and the RAM write speed via the system interface circuit. It requires display RAM write speed more than the minimum value that system processed and displayed. The system clock (SYSCLK) in VSYNC interfaces mode can be computed by the following formula that used some parameters with VFP, VBP and display lines duration (320 line):

$$\text{SYSCLK frequency}(fs) = \text{Frame Frequency} \times [\text{Display Lines}(321) + \text{VBP} + \text{VFP}] \times \text{HCK} \\ \times \text{frequency fluctuation}$$

VBP (Vertical Back porch) : set by R65

VFP (Vertical Front porch) : defined automatically (Min. 1 line is necessary)

HCK : The clock number of SYSCLK specifies the horizontal line period (1H), which is set by R139

The parameter of frequency fluctuation is ascribed to the external resistor or voltage variation, fabrication process condition, external temperature and humidity condition etc.

Then the minimum speed for display RAM write can be computed by the following formula:

$$\text{The Min. RAM Write Speed [Hz]} \geq \frac{240(\text{pixel}) \times \text{DisplayLines}(321) \times fs}{[VBP + DispLyLines(NL) - margin\ lines] \times HCK}$$

The margin line means when operate in VSYNC interface mode, it must be remained the several lines in advance for protection between the actual line of the display operation and the line address for the RAM write data operation.

Figure 3.6 VSYNC Interface Mode Operation

The mode transition flow between internally synchronized display mode and VSYNC interface mode is as Figure 3.7.

Figure 3.7 VSYNC Interface Mode and Internally Synchronized Mode Transition

3.3 Internal Clock Mode

The clock number of SYSCLK which is stored in the line clock register (R139) is used to specify the one horizontal line period (1H) in the internally synchronized display mode. The one horizontal line period (1H) can be adjusted by two ways. One is by calibration and another is by setting the clock number of one horizontal line period (1H) in a register. The horizontal cycle adjustment mode is defined by CLKM (D0 bit of the line cycle adjustment mode register , R141). Clock numbers will be stored into line clock register (R139) in both cases. In case of calibration, the value will be stored automatically. In case of register set up ,the value will be set from MPU.

0	Calibration Mode

Table 3. 2 Line Frequency Adjustment

Figure 3. 8 One Line Clock Number in Internal Clock Mode

3.3.1. Adjusting the one horizontal line period (1H) by calibration

Setting OC (D0 bit of the calibration register, R45) as "0" starts calibration. The calibration starts from the first positive edge of SYSCLK after D0=OC is set as "0". The HX8312-A counts the number of positive edges of SYSCLK until OC becomes "1". Then the HX8312-A writes the number of positive edges of SYSCLK (tcal) in the line clock register (R139). When LTS (D1 bit of the R1) is "1", the double number of the counted positive edges (tcalx2) will be set to R139.

Figure 3. 9 Adjust by Calibration

3.3.2. Adjusting the one horizontal line period by register set-up

First users need to specify the target frame frequency, which will drive the LCD (60 Hz commonly.) Next using the formula below, calculate the integer of HCK, so that it is close to the target frame frequency.

$$\text{Frame Frequency} = \frac{\text{SYSCLK}}{\text{HCK} \times (\text{GL} + 1)}$$

SYSCLK : System clock frequency
HCK : Raster-row clock number
GL+1 : Gate drive number (320) + 1 (dummy output)

Example:

$$60 \text{ Hz} = \frac{1200000 \text{ Hz}}{\text{HCK} \times (320 + 1)}$$

$$\text{HCK} = \frac{1200000}{60 \times 321} = 62.3$$

Please determine a value around HCK = 62 or 63 while drive the LCD with frame rate 60Hz. Remind that the setting in R139 can not be setting without the setting CLKM = "1", therefore the default setting of HCK="25" h stays valid.

Please note that the value in R139 must be \geq "20" h.

4. Display RAM

The HX8312-A have an internal graphics RAM that stores 1,382,400-bits data, where one pixel is expressed by 18 bits. By specifying arbitrary X and Y address, it is possible to access the display RAM.

The bit allocation of a pixel in the display RAM is as below.

Bit	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Allocation	R-Dot						G-Dot						B-Dot

The X size of display can be changed by setting NSO1-0 (D2-1 bits of R13).

When the X size is set as 208, the valid X addresses of the display RAM are from "00"h to "CF"h. Addresses "D0"h to "EF"h are invalid. Source outputs S313 to S408 are also invalid. When the X size is set as 180, the valid X addresses of the display data RAM are from "00"h to "B3"h. Addresses "B4"h to "EF"h are invalid. Source outputs S271 to S450 are also invalid.

By the ADC bit (D5 bit of R0) , the relation between the source output channel and the display data RAM address can be changed as reverse display. By setting the BGR bit (D0 bit of R193), the relation between the source output channel and the <R>,<G>, dot allocation can be reversed for different LCD color filter arrangement. Table 4. 2, 4. 3 and 4.4 show relation between the display RAM data allocation, the R,G,B dot allocation and the source output channel.

4.2 Display RAM Access

The HX8312-A contains a display RAM bus address counter (AC) which assigns X (pixel), Y(line) address for writing pixel data to display RAM. One X address equals to one pixel allocation. The display data will be written at a pixel which address is specified by X address register (R66) and Y address register 1, 2 (R67, R68). Every time when a pixel data is written into or read from the display RAM, the X address or Y address of AC will be automatically increased by 1 (or decreased by 1), which is decided by the register bits AM(D2 bit of R5), ADX(D7 bit of R1) and ADR(D6 bit of R1) setting.

ADX	X Address Direction		
	X Size = 180		X Size = 208
0	X0 X179 X0	X0 X207 X0	X0 X239 X0
1	X179 X0 X179	X207 X0 X207	X239 X0 X239

4.3 Window Address Area Access Mode

To simplify the address control of display RAM access, the window area address function allows for writing data only within a window area of display RAM specified by registers. Setting WAS (D4 bit of data access control register R5) as “1” starts the window area access mode. After writing data to the display RAM, the AC will be increased or decreased within setting window address-range which is specified by the MIN X address (R69) and MAX X address register (R70) or the MIN Y address 1, 2(R71, R72) and MAX Y address 1, 2(R73, R74) register. Therefore, data can be written consecutively without thinking a data wrap by those bit function. When use window access mode, please make sure the following address setting restriction:

$$\begin{aligned} "00"\text{h} \leq \text{MIN X address} \leq \text{X address} \leq \text{MAX X address} \leq "EF"\text{h} \\ "00"\text{h} \leq \text{MIN Y address} \leq \text{Y address} \leq \text{MAX Y address} \leq "13F"\text{h} \end{aligned}$$

The display RAM access address direction control still work in window access mode. In window access mode, the display RAM access X address boundary is restricted by R69 and R70 instead of X0 and X239 ; Y address boundary is restricted by R71,R72 and R73,R74 instead of Y0 and Y319.

5. Partial Display Mode

The HX8312-A enters a partial display mode when DTY (D4 bit of the control register 1 (R0)) is set as "1". The HX8312-A has one or two display window driving functions in partial display mode. The position of display screen register (R16-R23) can display at any line position of the whole screen. The numbers of display lines that display on the first and second display window must be less than total LCD-driving lines (320 lines). The number of the total selection driving lines included the 1st and 2nd display window must be equal to or less than the LCD Drive Line (320 lines).

Number of Scan Line: 320 lines

Ex: 1st Screen Setting: (R16, R17) = "0E"h, (R20, R21) = "0B"h
2nd Screen Setting: (R18, R19) = "4A"h, (R22, R23) = "14"h

- Note:**
1. The start driving line of partial areas are ((R16, R17) + 1) line for the first display window and ((R18, R19) +1) for second display window.
 2. Please make sure the conditions. (R16, R17 + R20, R21) <320 ,
(R18, R19 + R22, R23) < 320.
 3. For only one display window display operation, it can be set the same value in (R16,R17) , (R18,R19) and (R20,R21) , (R22,R23).
 4. That incorrect display may occur if the condition setting is not matched the spec.

Table 5. 10 Gate Scan Method in non-Display Areas of Partial Display Mode

Arbitrary frame refresh scan: (Inhibited to use)

Arbitrary frame refresh scan can be available in partial non-display area when frame inversion or N-line inversion driving scan is selected in display areas of partial display mode. By setting GSM (D0 bit of the control register 1, R0) as "1" and GSMLN7-0 (D7-0 bits of the partial gate register 1 , R52) are used to define the number of frame which gate scan will be performed in partial non-display area.

Please note that when GSMLN7-0 is set as "00h", no gate scan will be performed in the partial non-display areas.

6. Vertical Scroll Function

The HX8312-A incorporates a scroll display function, which performs a scroll display operation without repudiating display RAM for reducing chip RAM access. Since this scroll function is not automatic, please follow the instructions below to operate this function manually.

Figure 6. 1 Scroll Function Driving

To go back to the display before scrolling, please set the scroll step number register 1,2 (R79, R80) as "000" h. Please make sure to set the number of driving lines to be scrolled (set value of R79 and R80) less than the line number of the scroll area. When the value of R79, R80 exceeds the value of R77 and R78, please set new value which is less than R77 and R78 again to R79 and R80.

8. Gamma Adjustment Function

The HX8312-A incorporates gamma adjustment function for the 262,144-color display (64 grayscale for each R, G, B color). Gamma adjustment operation is implemented by deciding the 8 grayscale levels firstly in gamma adjustment control registers to match the LCD panel. Then total 64 grayscale levels are generated in grayscale voltage generator. These registers are available for both polarities. However, R, G, B can not be adjusted individually.

Figure 8. 1 Grayscale Control

8.1 Structure of Grayscale Voltage Generator

Eight reference gamma voltages $VgP/N(0, 1, 8, 20, 43, 55, 62, 63)$ for positive and negative polarity are specified by the center adjustment, the micro adjustment and the offset adjustment registers firstly. With those eight voltage injected into specified node of grayscale voltage generator, total 64 grayscale voltages ($V0-V63$) can be generated from grayscale amplifier for LCD panel used.

Figure 8. 2 Structure of Grayscale Voltage Generator

8.2 Gamma-Characteristics Adjustment Register

This HX8312-A has register groups for specifying a series grayscale voltage that meets the Gamma-characteristics for the LCD panel used. These registers are divided into two groups, which correspond to the gradient, amplitude, and macro adjustment of the voltage for the grayscale characteristics. The polarity of each register can be specified independently. (R, G, and B are common.)

(1)Gamma offset adjustment registers (R151, R152, R153, R154)

The offset adjustment variable registers are used to adjust the amplitude of the grayscale voltage. This function is implemented by controlling these variable resistors in the top and bottom of the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities

(2)Gamma center adjustment registers (R146, R150)

The gamma center adjustment registers are used to adjust the reference gamma voltage in the middle level of grayscale without changing the dynamic range. This function is implemented by choosing one input of 8 to 1 selector in the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities.

(3)Gamma macro adjustment registers (R143, R144, R145, R147, R148, R149)

The gamma macro adjustment registers can be used for fine adjustment of the reference gamma voltage. This function is implemented by controlling the 8-to-1 selectors (MP/N0~5), each of which has 8 inputs and generate one reference voltage output (VgP/N) 1, 8, 20, 43, 55, 62). These registers are available for both positive and negative polarities.

Register Groups	Positive Polarity	Negative Polarity	Description
Center Adjustment	CP0 2-0	CN0 2-0	Variable resistor (VRCP/N0) for center adjustment
	CP1 2-0	CN1 2-0	Variable resistor (VRCP/N1)for center adjustment

	MP5 2-0	MN5 2-0	8-to-1 selector (voltage level of grayscale 62)
Offset Adjustment	OP0 3-0	ON0 3-0	Variable resistor (VRDP/N0)for offset adjustment
	OP1 4-0	ON1 4-0	Variable resistor (VRDP/N1)for offset adjustment

8.3 Gamma Voltage Calculation Formula

Each circuit consists of two gamma resistor streams one is for positive polarity and the other is for negative polarity, each one including eight gamma reference voltages. ($V_{gP/N}$) 0, 1, 8, 20, 43, 55, 62, 63). Furthermore, the block has pin (VGS) to connect a variable resistor outside the chip for the variation between panels if needed.

9. 8-Color Display Mode Function

The HX8312-A supports an 8-color display mode by setting COLOR (D2 bit of R0) as "1". The grayscale level to be used is V0 and V63 with R5, G5, B5 decoding, and the other levels (V1-V62) are halted to reduce power consumption in 8-color display mode. In 8-color display mode, the Gamma-micro-adjustment registers are invalid and only the upper bits of RGB are used for display.

10. Display Operation Control

10.1 Display Driving Period Time Control

The HX8312-A can control the display operation period time for LCD panel driving as follow:

10.2 All "0" or "1" Source Output Display

By setting DISP1 and DISP0 (D7-6 bits of R0), HX8312-A can display data "0" or "1" on the whole LCD regardless of display RAM data and the data in the display RAM is not changed.

11. Scan Mode Setting

11.1 Scan Pattern

The number of gate-drive lines can be set by NSO1-0 (D2-1 bits of R13). Refer to "4.1 Relation between Display Data RAM and the LCD Panel".

The HX8312-A can set R/L (D3 bit of R29) and SCN[2:0] (D2-0 bits of R29) bits to determine the shift direction of gate outputs for different panel layout. And the DDS pin is used to set the position of dummy output pin in each mode. (Refer to "11.2. Blanking Period and Dummy Line Location")

11.2 Blanking Period and Dummy Line Location

The dummy line number selection register (R118) is used for setting the blanking period between two frame scan. The external DDS pin of HX8312-A determines to put the blanking period and a dummy line whether at the head or the end of a frame.

0	End: 1 frame scan + dummy (+7 blanking)
1	Head: (7 blanking +) dummy + 1 frame scan

Table 11. 3 DDS pin set-up

Note: 1. Please set R118:D0=DMYSEL as “0” when 3-field interlaced driving mode is selected.

(DMYSEL=“1” is not available when Skip 2B is selected)

2. R118 is not valid when the LCD displays operation is synchronization with an external clock

12. Oscillation Circuit

The HX8312-A can oscillate between the OSC1 and OSC2 pins using an internal R-C oscillator with an external oscillation resistor (R_f) or internal oscillation resistor 100Kohm(select by ROSC setting, D0 bit of R43). The oscillation frequency is changed according to the external resistance value, wiring length, or operating power-supply voltage. If R_f is increased or power supply voltage is decreased, the oscillation frequency decreases.

Figure 12. 1 Oscillation Circuit

The oscillation frequency can be adjust finely by setting RADJ2-0 (D3-1 bits of R43) as follow:

Internal R: 100 K ohm		RC oscillation frequency (MHz)		
RADJ[2:0]	correction	Vcc=2.5V	Vcc=2.8V	Vcc=3.3V
000	No	1.561	1.820	2.215
001	-10%	1.434	1.640	1.953
010	-20%	1.313	1.480	1.718
011	-30%	1.181	1.310	1.495
100	+10%	1.677	1.990	2.444

111	+40%	2.023	2.482	3.25

Table 12. 1 Frequency Adjustment (ROSC = 1)

The oscillation circuit on / off control can be defined by the OSCSTBY setting (D0 bit of R1), When OSCSTBY = "0", the oscillation circuit start to oscillate; when OSCSTBY = "1", the oscillation circuit stop to oscillate.

13. Power Generation

13.1 Power Supply Set up

HX8312-A has an internal power supply circuit to drive TFT LCD panel. Please set up each voltage output according to the LCD panel.

Name	Function	Set up Value	Note
VR1	Reference voltage for VR2 / DDVDH / VS / VDH generation	Vci x A (*1)	VR1 ≤ Vci – 0.15
VR2	Reference voltage for VGH generation	VR1 x B (*2)	VR2 ≤ Vci – 0.15
DDVDH	Step-up circuit 1 output Power supply for VS/VR/VDH/VCOM	VR1 x 2	Do not exceed 5.5V
VGH	(Step-up circuit 2 output) Gate on voltage	VR1 x C (*3)	Do not exceed 16.5V
VGL	(Step-up circuit 2 output) Gate off voltage	VR2 x D - VR1 x E (*3)	Do not lower than -16.5V
VCL	(Step-up circuit 3 output) Power supply for VCOML generation	Vci x (-1)	-
VS	Power supply for the source circuit output driving	VR1 x F (*4)	3.5V – 5.25V
VDH	Reference voltage for gamma circuit	VR1 x F (*4)	
VCOMH	VCOM high voltage	VS x G (*5)	-
VCOML	VCOM low voltage	VCOMH – VSxH (*6)	-
VCOM	VCOM voltage	-	Output VCOMH and VCOML voltage alternately.
V18	Logic power supply	1.8V	-

Table 13. 1 Power Supply Voltage Configuration

- Note :**
1. The value of A is determined by VR1SEL2-0 bits (D4-2 bits of register R25).
 2. The value of B is determined by VR2SEL2-0 bits (D7-5 bits of register R25).
 3. The value of C , D and E is determined by BT3-0 bits (D3-0 bits of register R37) setting and C21+ , C21- pin connection.
 4. The value of F is determined by VSEL2-0 bits (D3-1 bits of register R27).
 5. The value of F is determined by VCM4-0 bits (D4-0 bits of register R32).
 6. The value of G is determined by VDV4-0 bits (D4-0 bits of register R31).

16. Register Description

Register	Bit	Symbol	Function	Configuration
Control register 1				
R0 (R00h) default “A0“h	D7	DISP1	Source output data selection.	All source output as “0” or “1” selection Refer to “10.2 “ All “0” or “1” Source Output Display ”
	D6	DISP0	Source output data selection.	All source output as “0” or “1” selection Refer to “10.2 “ All “0” or “1” Source Output Display ”
	D5	ADC	Specifies source output and display RAM address mapping.	Refer to 4.1 “Relation between the Display RAM Address and the Source Output Channel”
	D4	DTY	Specifies partial display mode.	“0” : Normal display mode. “1” : Partial display mode. Refer to “5. Partial Display Mode”.
	D3	STBY	Specifies stand-by mode.	“0” : Normal operation. “1” : Stand-by mode.
	D2	COLOR	Specifies color mode.	“0” : 262,144 color mode. “1” : 8 color mode. Refer to “9 8-color Display Mode”.
	D1	-	-	-
	D0	GSM	Gate scan selection in partial-off display areas.	“0” : Normal scan in non-display area “1” : Configures the scanning cycle in non-display area by the number of the R52 register.
Control register 2				
R1 (R01h) default “00“h	D7	ADX	RAM X address increment direction after one write or read operation .	“0” : From X0 to X239 Refer to “4.2. Display RAM Access” “1” : From X239 to X0 *Note : ADX = “1” setting is prohibited when RGB interface circuit is in use.
	D6	ADR	RAM Y address increment direction after one write or read operation .	“0” : Y0 to Y319 Refer to “4.2. Display RAM Access” “1” : Y319 to Y0 *Note : ADR = “1” setting is prohibited when RGB interface circuit is in use.
	D5	-	-	-
	D4	GSEL	Specifies voltage level of V0 and V63	“0” : V0=VDH, V63 = VSSA. “1” : Depends on the OP0/1 and CP0/1 register setting. Refer to “8 Gamma Adjustment Function”.
	D3	-	-	-
	D2	-	-	-
	D1	LTS	Specifies setting period of calibration.	“0” : 1line period = tcal “1” : 1 line period = tcal x 2 Refer to “3.3 Internal Clock Mode”.
	D0	OSCSTBY	Oscillation control.	“0” : Starts oscillation. “1” : Stops oscillation.
RGB interface register 2				
R2 (R02h) default “00“h	D7	-	-	-
	D6	-	-	-
	D5	-	-	-
	D4	VMODE	VSYNC interface selection.	“0” : Normal Refer to “Table 9. 1”. “1” : Uses VSYNC interface.
	D3	-	-	-
	D2	RGBS	RGB interface writing mode selection.	“0” : Capture mode. Refer to “Table 9. 1”. “1” : Through mode.
	D1	DISPCK	Specifies display timing at RGB interface circuit.	“0” : Internally synchronized display mode by SYSCLK. “1” : Externally synchronized display mode by VSYNC and HSYNC. Refer to “Table 9. 1”.
	D0	NWRGB	RGB interface pin control.	“0” : Writes to the display data RAM via the system interface circuit. “1” : Writes to the display data RAM via the RGB interface circuit. Refer to “Table 9. 1”.

17. Electrical Characteristic

17.1 Absolute Maximum Ratings

The absolute maximum ratings are listed on Table 17.1. When used out of the absolute maximum ratings, the LSI may be permanently damaged. Using the LSI within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, the LSI will malfunction and cause poor reliability.

Item	Symbol	Unit	Value	Note
Power Supply Voltage (1)	VCC, IOVCC	V	-0.3 to +4.6	1,2
Power Supply Voltage (2)	VCI ~ VSSA	V	-0.3 to +4.6	1,2
Power Supply Voltage (3)	VLCD ~ VSSA	V	-0.3 to +6.0	3
Power Supply Voltage (4)	VSSA ~ VCL	V	-0.3 to +4.6	4
Power Supply Voltage (5)	VLCD ~ VCL	V	-0.3 to +9	5
Power Supply Voltage (6)	VGH ~ VSSA	V	-0.3 to +18.5	6
Power Supply Voltage (7)	VSSA ~ VGL	V	0 to -16.5	7
Input Voltage	Vi	V	-0.3 to VCC+0.3	-
Operating Temperature	Topr	°C	-40 to +85	8,9
Storage Temperature	Tstg	°C	-55 to +110	8,9

19. Revision History

Version	EFF.DATE	DESCRIPTION OF CHANGES
01	2005/05/06	New setup
02	2005/07/11	<ul style="list-style-type: none"> 1. Add note in p.11. 2. Change Pin 216 ~ Pin 219 from VSSD to VSSD2 inp.11 and p.12. 3. RGB interface description and drawing correction in p.37 ~ p.45 4. Add “Please note that the value in R139 must be \geq “20”h in p.49. 5. Add BGR bit function in p.50, p.51 and p.107. 6. Add “Inhibited to use” in p.52. 7. Delete note in p.53 8. Change note and setting value in example in p.55. 9. Change the color definition (Table.5.9) for PSEL bit setting in p.57. 10. Define SAW6-0 =“00h” in Table 6.2 as “setting inhibited” in p.59. 11. Delete WNRGB (D3 bit of R2) function in p.94. 12. Change: XVCOMG = 0 VCOML level is decided by VCM and VDV bits in p.83 and p.98. 13. Change device ID default value to “0C”h in R50 in p.100.
	2005/08/23	1. Add the “Ordering Information” section, page 120.
03	2005/10/04	<ul style="list-style-type: none"> 1. Delete “VDH pin description in p.11. 2. Correct the X address mapping in Table. 4.2 ~4.4 in p.51~ p.52. 3. Correct the width of chip from 1.670um to 1.670mm in p.18. 4. Correct the alignment mark circle diameter from 50um to 20um in p.19.
	2005/11/08	<ul style="list-style-type: none"> 1. Add AC and DC characteristic parameter in p.108~p.119. 2. Redrawing the on/off flow in p.89 and p.90 3. Change the power on / off flow in p.87
