## 3. GENERAL DATA

### 3.1 DISPLAY FEATURES

This module is a 9" WXGA of 16:9 format amorphous silicon TFT. The pixel format is vertical stripe and sub pixels are arranged as $R($ red), $G$ (green), $B$ (blue) sequentially. This display is RoHS compliant, and COG (chip on glass) technology and LED backlight are applied on this display.

| Part Name | TX23D86VM0BAA |
| :--- | :--- |
| Module Dimensions | $216.0(\mathrm{~W}) \mathrm{mm} \times 142.0(\mathrm{H}) \mathrm{mm} \times 11.7(\mathrm{D}) \mathrm{mm}$ |
| LCD Active Area | $193.920(\mathrm{~W}) \mathrm{mm} \times 116.352(\mathrm{H}) \mathrm{mm}$ |
| Pixel Pitch | $0.1515(\mathrm{~W}) \mathrm{mm} \times 0.1515(\mathrm{H}) \mathrm{mm}$ |

## 4. ABSOLUTE MAXIMUM RATINGS

| Item | Symbol | Min. | Max. | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Supply Voltage | VDD | 0 | 4.0 | V | - |
| Input Voltage of Logic | VI | -0.3 | VDD+0.3 | V | Note 1 |
| Operating Temperature | Top | -20 | 70 | ${ }^{\circ} \mathrm{C}$ | Note 2 |
| Storage Temperature | Tst | -30 | 80 | ${ }^{\circ} \mathrm{C}$ | Note 2 |
| Backlight Input Voltage | VLED | - | 15 | V | - |

Note 1: The rating is defined for the signal voltages of the interface such as CLK, and pixel data pairs.
Note 2: The maximum rating defined as above is based on the chamber temperature, which might be different from ambient temperature after assembling the panel into the application. Moreover, some temperature-related phenomenon as below needed to be noticed:

- Background color, contrast and response time would be different in temperatures other than $25^{\circ} \mathrm{C}$.
- Operating under high temperature will shorten LED lifetime.

## 5. ELECTRICAL CHARACTERISTICS

### 5.1 LCD CHARACTERISTICS

| Item | Symbol | Condition | Min. | Typ. | Max. | Unit | Remarks |

Note 1: $\mathrm{fV}=60 \mathrm{~Hz}$, $\mathrm{fCLK}=74.25 \mathrm{MHz}$, VDD=3.3V, DC Current.
Typical value is measured when displaying vertical 256 gray scale. Maximum is measured when displaying Vertical-stripe.

DC Ampere Meter

Note 2: 1.6A fuse is applied in the module for IDD. For display activation and protection purpose, power supply is recommended larger than 4.0A to start the display and break fuse once any short circuit occurred.

| PWM Signal Voltage | VPH | High | 3.1 | 3.3 | - | V | - |
|  | VPL | Low | - | 0 | 0.8 | V | - |
| PWM Duty | DPWM | - | 1 | - | 100 | $\%$ | - |
| LED lifetime | - | 480 mA | - | 70 K | - | hrs | Note 2 |

Note 1: LED current is constant, 480 mA , controlled by the LED driver when applying 12 V VLED.
Note 2: The estimated lifetime is specified as the time to reduce $50 \%$ brightness by applying 480 mA at $25^{\circ} \mathrm{C}$.

Note 3: Dimming function can be obtained by applying DC voltage or PWM signal from the display interface CN2. The recommended PWM signal is $0.2 \mathrm{~K} \sim 10 \mathrm{~K} \mathrm{~Hz}$ with 3.3 V amplitude.

## 6. OPTICAL CHARACTERISTICS

The optical characteristics are measured based on the conditions as below:

- Supplying the signals and voltages defined in the section of electrical characteristics.
- The backlight unit needs to be turned on for 30 minutes.
- The ambient temperature is $25^{\circ} \mathrm{C}$.
- In the dark room around 500~1000 lx, the equipment has been set for the measurements as shown in Fig 6.1.

|  |  | Y |  | 0.245 | 0.300 | 0.355 |  |  |

Note 1: The brightness is measured from 9 point of the panel, P1~P9 in Fig. 6.2, for the average value.
Note 2: The brightness uniformity is calculated by the equation as below:

$$
\text { Brightness uniformity }=\frac{\text { Min. Brightness }}{\text { Max. Brightness }} \times 100 \%
$$

, which is based on the brightness values of the 9 points measured by BM-5 as shown in Fig. 6.2.

Note 3: The Contrast ratio is measured from the center point of the panel, P5, and defined as the following equation:

$$
\mathrm{CR}=\frac{\text { Brightness of White }}{\text { Brightness of Black }}
$$

Note 4: The definition of response time is shown in Fig. 6.3. The rising time is the period from $10 \%$ brightness to $90 \%$ brightness when the data is from white to black. Oppositely, Falling time is the period from $90 \%$ brightness rising to $10 \%$ brightness.

Fig . 6.3
Note 5: The definition of viewing angle is shown in Fig. 6.4. Angle $\phi$ is used to represent viewing directions, for instance, $\phi=270^{\circ}$ means $60^{\prime}$ clock, and $\phi=0^{\circ}$ means 3 o'clock. Moreover, angle $\theta$ is used to represent viewing angles from axis Z toward plane XY .
The display is super wide viewing angle version; $85^{\circ}$ viewing angle can be obtained from each viewing direction.

## 9. LCD INTERFACE

### 9.1 INTERFACE PIN CONNECTIONS

The display interface connector is FI-XB30SL-HF10 made by JAE. More details of the connector are shown in the section of outline dimension.

Pin assignment of LCD interface is as below:

| Pin No. | Symbol | Description | Note | Pin No. | Symbol | Description | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note 1: All VDD pins must be connected to +3.3 V .
Note 2: All VSS pins must be connected to GND(0V). Metal bezel is connected internally to VSS.
Note 3: Please keep this pin open.
Note 4: In $\mathrm{n}^{-}$and $\mathrm{n}^{+}(\mathrm{n}=0,1,2,3)$, CLK IN- and CLK IN+ must be wired by twist-pairs or side by side FPC patterns, respectively.

The backlight interface connector is SM08B-SHLS (LF) (SN) made by JST, and pin assignment of backlight is as below:

| Pin No. | Signal | Function |
| :---: | :---: | :--- |
| $1 \sim 3$ | V $_{\text {LED }}+$ | Power Supply for LED (12V) |
| 4 | NC | No Connection |
| 5 | DIM | Backlight Brightness Dimming |
| $6 \sim 8$ | V $_{\text {LED }}$ |  |
|  | GND (0V) |  |

Note 1: In case Pin5 is not used, please apply 3.3V.

### 9.2 LVDS INTERFACE

CN1
(interface)

Note 1: $100 \Omega$ impedance of LVDS cable is recommended for best optical performance.
Note 2: Transmitter Made by THine : THC63LVDM83R or equivalent.
Note 3: Receiver (TCON30.3-F) • Made by THine : THC63LVDF84B equivalent.

### 9.5 INTERFACE TIMING SPECIFICATIONS

The column of timing sets including minimum, typical, and maximum as below are based on the best optical performance, frame frequency (Vsync) $=60 \mathrm{~Hz}$ to define. If 60 Hz is not the aim to set, less than 65 Hz for Vsync is recommended to apply for better performance by other parameter combination as the definitions in section 5.1.

### 9.9 POWER SEQUENCE

Power Sequence Timing

Note 1: In order to avoid any damages, VDD has to be applied before all other signals. The opposite is true for power off where VDD has to be remained on until all other signals have been switch off. The recommended time period is 1 second. Hot plugging might cause display damage due to incorrect power sequence, please pay attention on interface connecting before power on.
Note 2: In order to avoid showing uncompleted patterns in transient state. It is recommended that switching the backlight on is delayed for 1 second after the signals have been applied. The opposite is true for power off where the backlight has to be switched off 1 second before the signals are removed.

## 11. APPEARANCE STANDARD

The appearance inspection is performed in a dark room around 5001x~10001x based on the conditions as below:

- The distance between inspector's eyes and display is 30 cm .
- The viewing zone is defined with angle $\theta$ shown in Fig. 11.1 The inspection should be performed within $45^{\circ}$ when display is shut down. The inspection should be performed within $5^{\circ}$ when display is power on.

### 11.1 THE DEFINITION OF LCD ZONE

LCD panel is divided into 3 areas as shown in Fig. 11.2 for appearance specification in next section. A zone is the LCD active area (dot area); $B$ zone is the area, which extended 1 mm out from LCD active area; $C$ zone is the area between $B$ zone and metal frame.
In terms of housing design, B zone is the recommended window area customers' housing should be located in.

### 11.2 LCD APPEARANCE SPECIFICATION

The specification as below is defined as the amount of unexpected phenomenon or material in different zones of LCD panel. The definitions of length, width and average diameter using in the table are shown in Fig. 11.3 and Fig. 11.4.

Note 1: The definitions of dot defect are as below:

- The defect area of the dot must be bigger than half of a dot.
- For bright dot-defect, showing black pattern, the dot's brightness must be over 30\% brighter than others.
- For dark dot-defect, showing white pattern, the dot's brightness must be under 70\% darker than others.
- The definition of 1 -dot-defect is the defect-dot, which is isolated and no adjacent defect-dot.
- The definition of adjacent dot is shown as Fig. 11.5.
- The Density of dot defect is defined in the area within diameter $\phi=20 \mathrm{~mm}$.

The dots colored gray are adjacent to defect-dot A.

## 12. PRECAUTIONS

### 12.1 PRECAUTIONS OF ESD

1) Before handling the display, please ensure your body has been connected to ground to avoid any damages by ESD. Also, do not touch display's interface directly when assembling.
2) Please remove the protection film very slowly before turning on the display to avoid generating ESD.

### 12.2 PRECAUTIONS OF HANDLING

1) In order to keep the appearance of display in good condition, please do not rub any surfaces of the displays by sharp tools harder than 3H, especially touch panel, metal frame and polarizer.
2) Please do not pile the displays in order to avoid any scars leaving on the display. In order to avoid any injuries, please pay more attention for the edges of glasses and metal frame, and wear finger cots to protect yourself and the display before working on it.
3) Touching the display area or the terminal pins with bare hand is prohibited. This is because it will stain the display area and cause poor insulation between terminal pins, and might affect display's electrical characteristics furthermore.
4) Do not use any harmful chemicals such as acetone, toluene, and isopropyl alcohol to clean display's surfaces.
5) Please use soft cloth or absorbent cotton with ethanol to clean the display by gently wiping. Moreover, when wiping the display, please wipe it by horizontal or vertical direction instead of circling to prevent leaving scars on the display's surface, especially polarizer.
6) Please wipe any unknown liquids immediately such as saliva, water or dew on the display to avoid color fading or any permanently damages.
7) Maximum pressure to the surface of the display must be less than $1,96 \times 10^{4} \mathrm{~Pa}$. If the area of adding pressure is less than $1 \mathrm{~cm}^{2}$, the maximum pressure must be less than 1.96 N .

### 12.3 PRECAUTIONS OF OPERATING

1) Please input signals and voltages to the displays according to the values defined in the section of electrical characteristics to obtain the best performance. Any voltages over than absolute maximum rating will cause permanent damages to this display. Also, any timing of the signals out of this specification would cause unexpected performance.
2) When the display is operating at significant low temperature, the response time will be slower than it at $25 \mathrm{C}^{\circ}$. In high temperature, the color will be slightly dark and blue compared to original pattern. However, these are temperature-related phenomenon of LCD and it will not cause permanent damages to the display when used within the operating temperature.
3) The use of screen saver or sleep mode is recommended when static images are likely for long periods of time. This is to avoid the possibility of image sticking.
4) Spike noise can cause malfunction of the circuit. The recommended limitation of spike noise is no bigger than $\pm 100 \mathrm{mV}$.

- 

### 12.4 PRECAUTIONS OF STORAGE

If the displays are going to be stored for years, please be aware the following notices.

1) Please store the displays in a dark room to avoid any damages from sunlight and other sources of UV light.
2) The recommended long term storage temperature is between $10 \mathrm{C}^{\circ} \sim 35 \mathrm{C}^{\circ}$ and $55 \% \sim 75 \%$ humidity to avoid causing bubbles between polarizer and LCD glasses, and polarizer peeling from LCD glasses.
3) It would be better to keep the displays in the container, which is shipped from Hitachi, and do not unpack it.
4) Please do not stick any labels on the display surface for a long time, especially on the polarizer.

## 13. DESIGNATION of LOT MARK

1) The lot mark is showing in Fig.13.1. First 4 digits are used to represent production lot, T represented made in Taiwan, and the last 6 digits are the serial number.

2) The tables as below are showing what the first 4 digits of lot mark are shorted for.

| Year | Mark |
| :---: | :---: |
| 2011 | 1 |
| 2012 | 2 |
| 2013 | 3 |

| $8 \sim 14$ | 2 |
| $15 \sim 21$ | 3 |
| $22 \sim 28$ | 4 |
| $29 \sim 31$ | 5 |

3) Except letters I and O, revision number will be shown on lot mark and following letters A to Z .
4) The location of the lot mark is on the back of the display shown in Fig. 13.1.
