**1.0 GENERAL DESCRIPTION**

1.1 Introduction

HT15X22-300 is a color active matrix TFT LCD module using amorphous silicon TFT's (Thin Film Transistors) as an active switching devices. This module has a 15.0 inch diagonally measured active area with XGA resolutions (1024 horizontal by 768 vertical pixel array). Each pixel is divided into RED, GREEN, BLUE dots which are arranged in vertical stripe and this module can display 16,777,216 colors. The TFT-LCD panel used for this module is wide viewing angle (Horizontal viewing angle: 160°, Vertical viewing angle: 160°) by U-FFS™ (Ultra Fringe Field Switching) mode.

1.2 Features

- Desktop type of PC Use
- Display terminals for control system
- Monitors for process controller
- UFFS (Ultra Fringe Field Switching) Mode
- TTL Interface with 2pixel / clock
- High-speed response
- 256 Gray Scale (8 bits)
- Incorporated edge type back-light (Four lamps, Inverter optional)
- High luminance and Contrast ratio, Low reflection and wide viewing angle
- DE (Data Enable) Mode only

Note:

- 1. Viewing angle is the angle at which the contrast ratio is greater than 10. The viewing are determined for the horizontal or 3, 9 o'clock direction and the vertical or 6, 12 o'clock direction with respect to the optical axis which is normal to the LCD surface (see FIGURE 1 shown in Appendix).
- 2. Contrast measurements shall be made at viewing angle of  $\theta = 0^\circ$  and at the center of the LCD surface. Luminance shall be measured with all pixels in the view field set first to white, then to the dark (black) state. (See FIGURE 1 shown in Appendix) Luminance Contrast Ratio (CR) is defined mathematically.

$$CR = \frac{\text{Luminance when displaying a white raster}}{\text{Luminance when displaying a black raster}}$$

- 3. Center Luminance of white is defined as center measurement points across the LCD surface. The other condition is same note 4.
- 4. The White luminance uniformity on LCD surface is then expressed as :  $\Delta Y = \text{Maximum Luminance of five points} / \text{Minimum Luminance of five points}$  (see FIGURE 2 shown in Appendix).
- 5. The color chromaticity coordinates specified in Table 4. shall be calculated from the spectral data measured with all pixels first in red, green, blue and white. Measurements shall be made at the center of the panel.
- 6. The electro-optical response time measurements shall be made as FIGURE 3 shown in Appendix by switching the "data" input signal ON and OFF. The times needed for the luminance to change from 10% to 90% is Td, and 90% to 10% is Tr.
- 7. Cross-Talk of one area of the LCD surface by another shall be measured by comparing the luminance ( $Y_A$ ) of a 25mm diameter area, with all display pixels set to a gray level, to the luminance ( $Y_B$ ) of that same area when any adjacent area is driven dark. (See FIGURE 4 shown in Appendix).

## 9.0 POWER SEQUENCE

To prevent a latch-up or DC operation of the LCD module, the power on/off sequence shall be as shown in below

- $0 < T1 \leq 5 \text{ ms}$
- $0 < T2 \leq 30 \text{ ms}$
- $110 \text{ ms} \leq T3$
- $0 \leq T4$
- $0 < T5 \leq 30 \text{ ms}$
- $0 < T6 \leq 1 \text{ sec.}$
- $1 \text{ sec} \leq T7$

Notes:

1. When the power supply VDD is 0V, Keep the level of input signals on the low or keep high impedance.
2. Do not keep the interface signal high impedance when power is on.
3. Back Light must be turn on after power for logic and interface signal are valid.

**12.0 HANDLING & CAUTIONS**

## 12.1 Cautions when taking out the module

- Pick the pouch only, when taking out module from a shipping package.

## 12.2 Cautions for handling the module

- As the electrostatic discharges may break the LCD module, handle the LCD module with care. Peel a protection sheet off from the LCD panel surface as slowly as possible.
- As the LCD panel and backlight element are made from fragile glass material, impulse and pressure to the LCD module should be avoided.
- As the surface of the polarizer is very soft and easily scratched, use a soft dry cloth without chemicals for cleaning.
- Do not pull the interface connector in or out while the LCD module is operating.
- Put the module display side down on a flat horizontal plane.
- Handle connectors and cables with care.

## 12.3 Cautions for the operation

- When the module is operating, do not lose ICLK, DE signals. If any one of these signals were lost, the LCD panel would be damaged.
- Obey the supply voltage sequence. If wrong sequence were applied, the module would be damaged.

## 12.4 Cautions for the atmosphere

- Dewdrop atmosphere should be avoided.
- Do not store and/or operate the LCD module in a high temperature and/or humidity atmosphere. Storage in an electro-conductive polymer-packing pouch and under relatively low temperature atmosphere is recommended.

## 12.5 Cautions for the module characteristics

- Do not apply fixed pattern data signal to the LCD module at product aging.
- Applying fixed pattern for a long time may cause image sticking.

## 12.6 Other cautions

- Do not disassemble and/or re-assemble LCD module.
- Do not re-adjust variable resistor or switch etc.
- When returning the module for repair or etc, please pack the module not to be broken. We recommend using the original shipping packages.

Diagrammatic representation of measurement locations:
 

- Two circles are shown at the top left.
- Two circles are shown at the bottom left.
- A single circle is shown on the left side, aligned with the 384 row of the table.

**Figure 3. Response Time Testing**

**Figure 4. Cross Modulation Test Description**

$$\text{Cross-Talk} = \left| \frac{Y_B - Y_A}{Y_A} \right| \times 100$$

Where:

$Y_A$  = Initial luminance of measured area ( $\text{cd}/\text{m}^2$ )

$Y_B$  = Subsequent luminance of measured area ( $\text{cd}/\text{m}^2$ )

The location measured will be exactly the same in both patterns.
