#### VCCS rising time is 0.5ms

Note (3) The specified power supply current is under the conditions at VCCS = 3.3 V, Ta = 25  $\pm$  2 °C, DC Current and  $f_v$  = 60 Hz, whereas a specified power dissipation check pattern is displayed.

- Note (4) The specified signals have equivalent impedances pull down to ground in the LCD module respectively. Customers should keep the input signal level requirement with the load of LCD module. Please refer to Note (4) of 4.3.2 LED CONVERTER SPECIFICATION to obtain more information.
- Note (5) When a source detects a low-going HPD pulse, it must be regarded as a HPD event. Thus, the source must read the link / sink status field or receiver capability field of the DPCD and take corrective action.

ILED<sub>IS</sub>: the maximum current of the first 100ms after power-on,

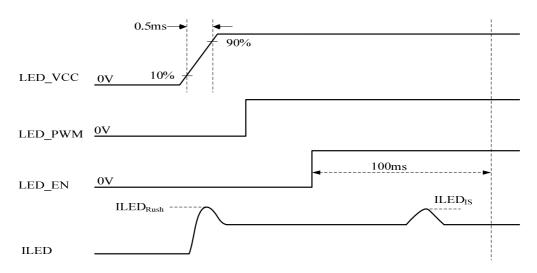

Measurement Conditions: Shown as the following figure. LED\_VCCS = Typ, Ta =  $25 \pm 2$  °C,  $f_{PWM}$  = 200 Hz, Duty=100%.

Version 1.0 20 April 2016 10 / 47

#### VLED rising time is 0.5ms

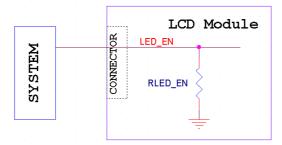

Note (2) If PWM control frequency is applied in the range less than 1KHz, the "waterfall" phenomenon on the screen may be found. To avoid the issue, it's a suggestion that PWM control frequency should follow the criterion as below.

PWM control frequency  $f_{\text{PWM}}$  should be in the range

$$(N+0.33)*f \le f_{\text{PWM}} \le (N+0.66)*f$$
 $N: \text{Integer } (N \ge 3)$ 
 $f: \text{Frame rate}$ 

- Note (3) The specified LED power supply current is under the conditions at "LED\_VCCS = Typ.", Ta = 25  $\pm$  2 °C, f<sub>PWM</sub> = 200 Hz, Duty=100%.
- Note (4) The specified signals have equivalent impedances pull down to ground in the LCD module respectively. Customers should keep the input signal level requirement with the load of LCD module. For example, the figure below describes the equivalent pull down impedance of LED\_EN (If it exists). The rest pull down impedances of other signals (eg. HPD, PWM ...) are in the same concept.

Note (5) If the cycle-to-cycle difference of PWM duty exceeds 0.1%, especially when the PWM duty is low, slight brightness change might be observed.

Note (1) LED current is measured by utilizing a high frequency current meter as shown below:

Note (2) For better LED light bar driving quality, it is recommended to utilize the adaptive boost converter with current balancing function to drive LED light-bar.

Note (3)  $P_L = I_L \times V_L$  (Without LED converter transfer efficiency)

Note (4) The lifetime of LED is defined as the time when it continues to operate under the conditions at Ta =  $25 \pm 2$  °C and I<sub>L</sub> = 23.0 mA(Per EA) until the brightness becomes  $\leq 50\%$  of its original value.

Note (1) Definition of Viewing Angle ( $\theta x$ ,  $\theta y$ ):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

Contrast Ratio (CR) = L63 / L0

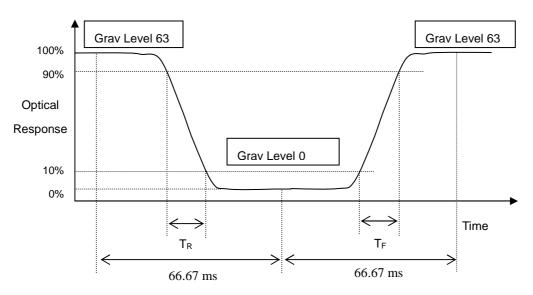

L63: Luminance of gray level 63

L 0: Luminance of gray level 0

CR = CR(1)

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time  $(T_R, T_F)$ :

Note (4) Definition of Average Luminance of White (LAVE):

Measure the luminance of White at 5 points

$$L_{AVE} = [L(1) + L(2) + L(3) + L(4) + L(5)] / 5$$

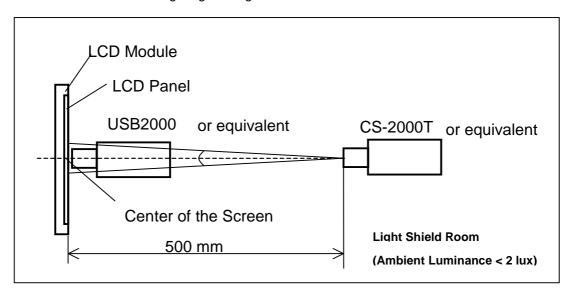

L(x) is corresponding to the luminance of the point X at Figure in Note (6)

Version 1.0 20 April 2016 **21 / 47** 

#### Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

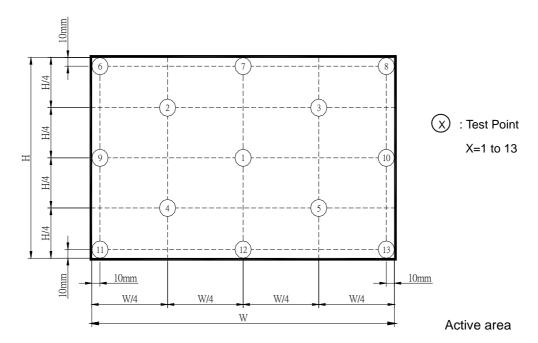

#### Note (6) Definition of White Variation ( $\delta W$ ):

Measure the luminance of gray level 63 at 5 points

 $\delta W_{5p} = Minimum [L (1)~L (5)] / Maximum [L (1)~L (5)]$ 

 $\delta W_{13p}$  = Minimum [L(1)  $\sim$  L(13)] / Maximum [L(1)  $\sim$  L(13)]

Version 1.0 20 April 2016 22 / 47

Note (7) The listed optical specifications refer to the initial value of manufacture, but the condition of the specifications after long-term operation will not be warranted.

Note (8) Definition of color gamut (C.G%):

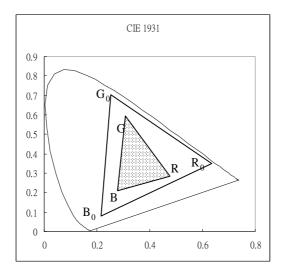

C.G%=  $R G B / R_0 G_0 B_0,*100\%$ 

R<sub>0</sub>, G<sub>0</sub>, B<sub>0</sub>: color coordinates of red, green, and blue defined by NTSC, respectively.

R, G, B: color coordinates of module on 63 gray levels of red, green, and blue, respectively.

 $R_0$   $G_0$   $B_0$ : area of triangle defined by  $R_0$ ,  $G_0$ ,  $B_0$ 

R G B: area of triangle defined by R, G, B

#### 8. PRECAUTIONS

#### 8.1 HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the LED wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.

#### **8.2 STORAGE PRECAUTIONS**

- (1) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (2) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (3) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly, and the starting voltage of LED will be higher than the room temperature.

#### 8.3 OPERATION PRECAUTIONS

- (1) Do not pull the I/F connector in or out while the module is operating.
- (2) Always follow the correct power on/off sequence when LCD module is connecting and operating. This can prevent the INXS LSI chips from damage during latch-up.
- (3) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with converter. Do not disassemble the module or insert anything into the Backlight unit.
