1. General Description

The LP141WX5 is a Color Active Matrix Liquid Crystal Display with an integral backlight system. The matrix employs a-Si Thin Film Transistor as the active element. It is a transmissive type display operating in the normally white mode. This TFT-LCD has 14.1 inches diagonally measured active display area with WXGA resolution (800 vertical by 1280 horizontal pixel array). Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 6-bit gray scale signal for each dot, thus, presenting a palette of more than 262,144 colors.

The LP141WX5 has been designed to apply the interface method that enables low power, high speed, low EMI.

The LP141WX5 is intended to support applications where thin thickness, low power are critical factors and graphic displays are important. In combination with the vertical arrangement of the sub-pixels, the LP141WX5 characteristics provide an excellent flat display for office automation products such as Notebook PC.

<td>%RH</td>
</tr>
</tbody>
</table>

Note: 1. Temperature and relative humidity range are shown in the figure below. Wet bulb temperature should be 39°C Max, and no condensation of water.
3. Electrical Specifications

3-1. Electrical Characteristics

The LP141WX5 requires two power inputs. One is employed to power the LCD electronics and to drive the TFT array and liquid crystal. The second input which powers the LED, is typically generated by an inverter. The inverter is an external unit to the LCD.

<td></td>
<td></td>
</tr>
</tbody>
</table>

Note

1. The specified current, voltage and power consumption are under the Vcc = 3.3V, 25°C, fν = 60Hz condition whereas Mosaic pattern is displayed and fν is the frame frequency.

2. This impedance value is needed to proper display and measured form LVDS Tx to the mating connector.

3. The variance of the voltage is ± 10%.

4. The typical operating current is for the typical surface luminance (L_{WH}) in optical characteristics. I_{LED} is the current of each LEDs' string, LED backlight has 6 strings on it.

5. The LED power consumption shown above does not include power of external LED driver circuit for typical current condition.

6. The life time is determined as the time at which brightness of LED is 50% compare to that of minimum value specified in table 7.
3-2. Interface Connections
This LCD employs two interface connections, a 30 pin connector is used for the module electronics interface and the other connector is used for the integral backlight system.
The electronics interface connector is a model GT101-30S-HR11 manufactured by LSC.

Note:
1. Valid Data is Data to meet “3-3. LVDS Signal Timing Specifications”
2. Please avoid floating state of interface signal at invalid period.
3. When the interface signal is invalid, be sure to pull down the power supply for LCD VCC to 0V.
4. LED power must be turn on after power supply for LCD and interface signal are valid.
4. Optical Specification

Optical characteristics are determined after the unit has been ‘ON’ and stable for approximately 30 minutes in a dark environment at 25°C. The values specified are at an approximate distance 50cm from the LCD surface at a viewing angle of φ and θ equal to 0°.

FIG. 1 presents additional information concerning the measurement equipment and method.

Product Specification

Note:
1. Contrast Ratio (CR) is defined mathematically as
   \[
   \text{Contrast Ratio} = \frac{\text{Surface Luminance with all white pixels}}{\text{Surface Luminance with all black pixels}}
   \]

2. Surface luminance is the average of 5 point across the LCD surface 50cm from the surface with all pixels displaying white. For more information see FIG 1.
   \[
   L_{WH} = \text{Average}(L_1, L_2, \ldots L_5)
   \]

3. The variation in surface luminance, The panel total variation (δ\text{WHITE}) is determined by measuring \(L_N\) at each test position 1 through 13 and then defined as followed numerical formula. For more information see FIG 2.
   \[
   \delta_{\text{WHITE}} = \frac{\text{Maximum}(L_1, L_2, \ldots L_{13})}{\text{Minimum}(L_1, L_2, \ldots L_{13})}
   \]

4. Response time is the time required for the display to transition from white to black (rise time, \(T_{R}\)) and from black to white (Decay Time, \(T_{D}\)). For additional information see FIG 3.

5. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface. For more information see FIG 4.

[ DETAIL DESCRIPTION OF SIDE MOUNTING SCREW ]

- Screw Length(A) : Max : 2.5, Min : 2.0
- Screw Depth(B) : Min 2.5
- Screw Torque : Max 2.5kgf.cm (Measurement Gauge: Torque Meter)

Notes : 1. Screw plated through the method of non-electrolytic nickel plating is preferred to reduce possibility that results in vertical and/or horizontal line defect due to the conductive particles from screw surface.
## LPL Proposal for system cover design (Appendix)

<table>
<thead>
<tr>
<th></th>
<th>Gap check for securing the enough gap between LCM and System cover.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><img src="image1" alt="Diagram of gap check" /></td>
</tr>
<tr>
<td></td>
<td>Max thickness</td>
</tr>
<tr>
<td></td>
<td>LCM reflector side</td>
</tr>
<tr>
<td></td>
<td>Sponge</td>
</tr>
<tr>
<td></td>
<td>A boundary line</td>
</tr>
<tr>
<td></td>
<td>System cover</td>
</tr>
</tbody>
</table>

### Define

1. Rear side of LCM is sensitive against external stress, and previous check about interference is highly needed.
2. In case there is something from system cover comes into the boundary above, mechanical interference may cause the FOS defects. (Eg: Ripple, White spot..)

<table>
<thead>
<tr>
<th></th>
<th>Check if antenna cable is sufficiently apart from T-CON of LCD Module.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td><img src="image2" alt="Diagram of antenna cable" /></td>
</tr>
<tr>
<td></td>
<td>NO GOOD</td>
</tr>
<tr>
<td></td>
<td>GOOD</td>
</tr>
</tbody>
</table>

### Define

1. If system antenna is overlapped with T-CON, it might be cause the noise.
## LPL Proposal for system cover design.

### 3

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| Gap check for securing the enough gap between LCM and System hinge. | ![Diagram](image)

**Define**

1. At least 2.0mm of gap needs to be secured to prevent the shock related defects.

2. "L" type of hinge is recommended than "I" type under shock test.

### 4

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
</table>
| Checking the path of the System wire. | ![Diagram](image)

**Define**

1. COF area needs to be handled with care.

2. GOOD ➔ Wire path design to system side.
   - OK ➔ Wire path is located between COFs.
   - BAD ➔ Wire path overlapped with COF area.
**LPL Proposal for system cover design.**

<p>| | |</p>
<table>

<table>
<thead>
<tr>
<th>Define</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Condition without bracket is good for mechanical noise, and can minimize the light leakage from deformation of bracket.</td>
<td></td>
</tr>
<tr>
<td>2. The results shows that there is no difference between the condition with or without bracket.</td>
<td></td>
</tr>
</tbody>
</table>

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>6</strong></td>
<td>Securing additional gap on CNT area.</td>
</tr>
</tbody>
</table>

**Define**

1. CNT area is specially sensitive against external stress, and additional gap by cutting on system cover will be helpful on removing the Ripple.
2. Using a thinner CNT will be better. (eg: FPC type)

b) Location of Lot Mark

Serial No. is printed on the label. The label is attached to the backside of the LCD module. This is subject to change without prior notice.

8-2. Packing Form

a) Package quantity in one box: 30 pcs

b) Box Size: 484mm × 372mm × 288mm
9. PRECAUTIONS

Please pay attention to the followings when you use this TFT LCD module.

9-1. MOUNTING PRECAUTIONS

(1) You must mount a module using holes arranged in four corners or four sides.
(2) You should consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to the module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
(3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to the resist external force.
(4) You should adopt radiation structure to satisfy the temperature specification.
(5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
(6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment.
Do not touch the surface of polarizer for bare hand or greasy cloth.(Some cosmetics are detrimental to the polarizer.)
(7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front / rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
(8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
(9) Do not open the case because inside circuits do not have sufficient strength.

9-2. OPERATING PRECAUTIONS

(1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage:
\[ V = \pm 200mV \text{ (Over and under shoot voltage)} \]
(2) Response time depends on the temperature. (In lower temperature, it becomes longer.)
(3) Brightness depends on the temperature. (In lower temperature, it becomes lower.)
   And in lower temperature, response time(required time that brightness is stable after turned on) becomes longer.
(4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
(5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
(6) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimized the interference.
9-3. ELECTROSTATIC DISCHARGE CONTROL
Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wrist band etc. And don’t touch interface pin directly.

9-4. PRECAUTIONS FOR STRONG LIGHT EXPOSURE
Strong light exposure causes degradation of polarizer and color filter.

9-5. STORAGE
When storing modules as spares for a long time, the following precautions are necessary.

(1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
(2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.

9-6. HANDLING PRECAUTIONS FOR PROTECTION FILM
(1) When the protection film is peeled off, static electricity is generated between the film and polarizer. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
(2) The protection film is attached to the polarizer with a small amount of glue. If some stress is applied to rub the protection film against the polarizer during the time you peel off the film, the glue is apt to remain on the polarizer.
   Please carefully peel off the protection film without rubbing it against the polarizer.
(3) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the polarizer after the protection film is peeled off.
(4) You can remove the glue easily. When the glue remains on the polarizer surface or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.
