c. Front light driving conditions

Parameter	Symbol	Min	Typ	Max	Units	Remark
Lamp voltage	$V_L$	-	(335)	-	Vrms	
Lamp current	$I_L$	-	(1.4)	-	mArms	
Frequency	$F_L$	50	60	100	KHz

Lamp life time	LL	10,000	-	-	hour	

Note 1: T= 25°C,  $I_L=1.4mA$

Note 2: Inverter should be designed with the characteristic of lamp. When you are designing the inverter, the output voltage of the inverter should comply with the following conditions.

- (1). The area under the positive and negative cycles of the waveform of the lamp current and lamp voltage should be area symmetric(the symmetric ratio should be larger than 90%).

- (2). There should not be any spikes in the waveform.
- (3). The waveform should be sine wave as possible.
- (4). Lamp current should not exceed the maximum value within the operating Temperature (It is prohibited to over the maximum lamp current even if operated in The non-guaranteed temperature). When lamp current over the maximum value for a long time, it may cause fire. Therefore, it is recommend that the inverter should have the current limited circuit.

Note 3: Lamp frequency may produce interference with horizontal synchronous frequency and this may cause line flow on the display. Therefore lamp frequency shall be detached from the horizontal synchronous frequency and its harmonics as far as possible in order to avoid interference.

Note 4: Brightness ( $I_L=1.4mA$ ) to be decrease to the 50% of the initial value.

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L63 / L0$$

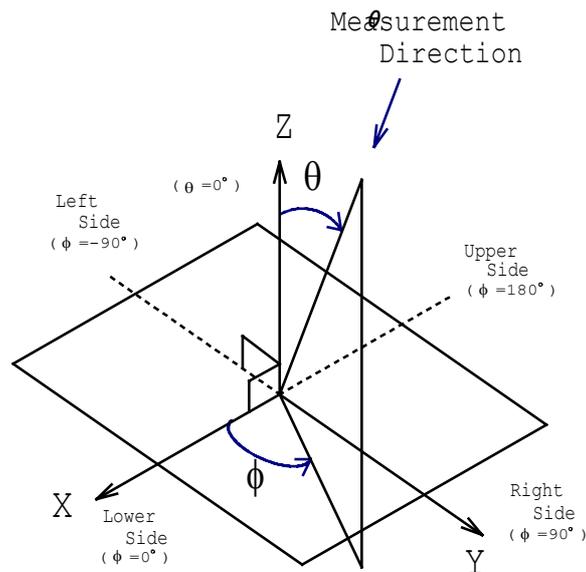

L63: Luminance on the white raster (gray scale level L63)

L 0: Luminance on the black raster (gray scale level L0)

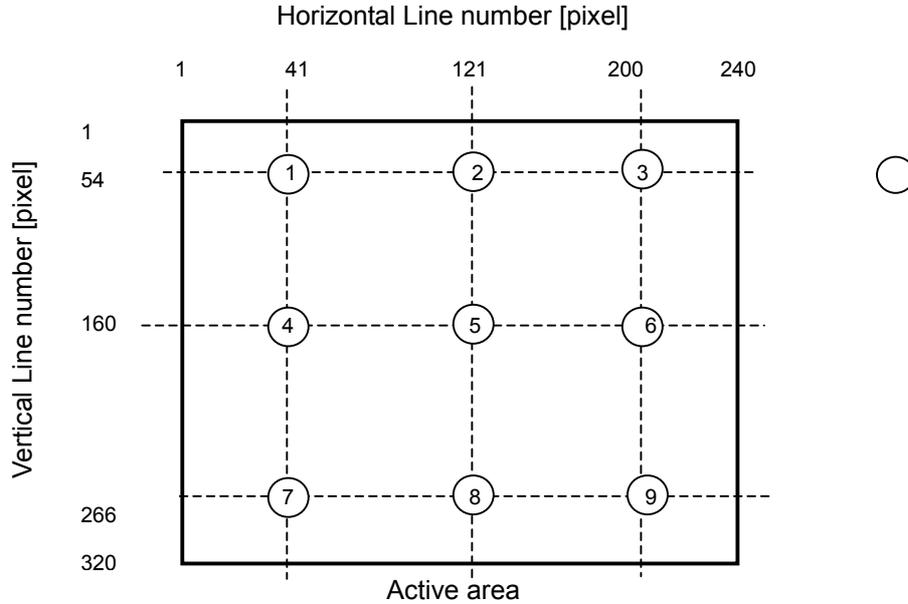

$$CR_{AVE} = (CR (1)+CR (3)+CR (5)+CR (7)+CR (9))/ 5$$

CR (X) is corresponded to the Contrast Ratio of a point of X

Note 7: Definition of the 9 points ( from 1 to 9) on panel, refer to figure as below

Note 8: Definition of brightness: To average the luminance of center 5 points (1, 3, 5, 7, 9)

Average Luminance of White  $Y_{L,AVE}$

$$Y_{L,AVE} = (Y_{L1} + Y_{L3} + Y_{L5} + Y_{L7} + Y_{L9}) / 5$$

$Y_{LX}$  is corresponded to the Luminance of a point of X

Note 9: Driving conditions for CCFL :  $I_L = 1.4$  mA, 60KHz Frequency

Note 10: Definition of white uniformity:

$$\delta_w = \frac{\text{Maximum Luminance of nine points (brightness)}}{\text{Minimum Luminance of nine points (brightness)}}$$
